Designs

Accompanying illustration shows one of two "SMITH" Turbine Units now being installed in the Ontario Power Co. Plant of the Hydro Electric Power Commission of Ontario, at Niagara Falls, Ontario. Each Unit is capable of developing a maximum of 19,000 Horse Power at 187½ Revolutions per minute under 180 feet head.

WIRES AND CABLES

YOU'VE seen it. The large Reel with the Northern Electric Company's name on either side. You can see it wherever wire work of any kind is being done. In the small hamlets and in the large cities throughout the Dominion, it is a familiar sight by the street-side.

Quality, Dependability and Service is what has made the **NORTHERN ELECTRIC COMPANY LIMITED** the largest manufacturers of bare and insulated Wire and Cable.

Our Nearest House will be glad to furnish specifications and prices on any type of bare or insulated wire and cable for electrical purposes—write us to-day.

How Long Does It Take You ?

When you have to change the Potential or Current Coils on your Service Meters, if you are using the Sangamo Product note these advantages:—

- (1) The moving element is not dismantled.
- (2) The new potential coil built on the core is replaced as a unit.
- (3) Current Coils can be changed in a few seconds.
- (4) The Air Gap does not change as all parts are dowelled.
- (5) Simplicity and thoroughness of design makes faulty assembly an impossibility.

Write our nearest house for particulars and prices.

A Comparison

Sherardizing Steel & Creosoting Wood

The Purchasing Agent for one of the largest Hydro-Electric Power Companies, upon having the Sherardizing Process thoroughly explained to him, remarked:

"Then Sherardizing, as a method of protecting steel, is like creosoting for protecting wood."

He has since insisted upon the delivery of SHERARDUCT on all conduit orders.

The two processes are markedly similar, both in treatment and results attained. SHERARDUCT is the only Sherardized Rigid Steel Conduit. Both interior and exterior surfaces are Sherardized and further protected by coatings of a clear acid- and alkali-proof enamel, baked on. Has the combined advantages of zinc and enamel protection. Double value for one price. We can't tell you all about it here; write for complete information.

We urge you to use these famous, "better service" Keystone Car Specialties

Faraday Car Signal Systems

Operates from line voltage—no batteries. Faraday Push Buttons, Buzzers and Resistances furnish an ideal, failure-proof car signal system.

Illuminated Car Signs

With these signs destination names can easily be changed and cars rerouted. Well labeled cars make more money.

Keystone Rotary Gongs

A louder gong and more continuous to meet requirements resulting from modern, heavy, noisy traffic in cities.

Safety Car Lighting Fixtures

To light your cars scientifically, efficiently and safely. To save you money.

Keystone Motorman's Seat

For the motorman or conductor. A real collapsible, safe and durable seat. They make operators more contented.

"Golden Glow" Headlights

To light up a path to safety for your cars. Only their famous reflectors can project the distinctive "Golden Glow" light.

Keystone Trolley Catchers

To protect your overhead construction from "flying" poles thus preventing delays and tie-ups.

Keystone Air Sanders and Valves

To automatically sand your tracks by compressed air. A real device for safety and accident prevention.

THE STEEL COMPANY OF CANADA LIMITED HAMILTON MONTREAL

The "FRANKLIN"

Positive Lock
as incorporated in the
FRANKLIN
Disconnecting Switch

Note the Closed Bridge

formed by the brass jaws meeting above the Switch-Blade. These jaws cannot be forced open by electrical expulsion strains, because the only direction in which they can open is **opposite** to that of the resultant electrical force. The jaw castings are rugged and rigidly fixed.

A pull of a hook in the pull-ring causes the cams of the pull-ring to rotate against the lugs of the jaw castings. The jaws are thus rotated against the springs, the bridge opens and the blade passes out—all with a single easy pull.

When the switch is to be closed, the bevelled tops of the jaws let the blade slip easily into place. Then the springs close the bridge with a vigorous snap that tells you the blade is home to stay.

Bulletin 1250 describes "FRANKLIN" disconnecting Switches with "FRANKLIN" Positive Locks. Write for it, stating service and voltage.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

The Electrician's Pride

The electrician who takes pride in the quality of his work is doubly proud when the motor he has installed is a Robbins and Myers. He sees in it the quality which will match his work and insure satisfactory service from the installation.

The Dealer who sells R. & M. Motors can depend upon better co-operation from the workmen who install them, whether they are his own employees or those of the

motor user. Quality in the motors inspires quality in the wiring and installation work.

The combination is a guarantee of satisfactory service for the motor user and repeat orders for the dealer.

R. & M. Motors are made for direct and alternating current, in sizes from 1/40 to 30 horse-power inclusive.

No. 1

International Fair at Lyons an Opportunity for Continental Trade Openings

On March 1st, 1919, the fourth International Fair to be held at Lyons, France, will be opened and will remain open for two weeks. This fair was organized during the war primarily to give impetus to French commerce. Its development during the four years it has been in existence has been phenomenal and it will probably replace the world-famed annual fair, which, before the war, was held at Leipsig, Germany. Mr. W. M. Clarke, Canadian Trade Commissioner at Milan, Italy, states that the fair is not a place where merchants assemble their products and sell them to visitors, but it is a sample show where producers and buyers meet and from samples shown important purchases are made, delivery of which is made direct from the seller on conditions that vary as regards time and place.

At the 1916 fair, there were 1,342 exhibitors and business amounting to \$10,400,000 was transacted. In 1917, there were 2,593 exhibitors and business valued at \$82,000,000 resulted. In 1918, there were 3,176 exhibitors who did business amounting to \$150,000,000.

It is worthy of note that of the 543 exhibitors from the United States in 1918, 405 displayed catalogues and price lists only, orders being placed under the direction of the American Consul-General at Lyons. Nevertheless, it is reported that the business transacted by United States firms formed a very important part of the total sales.

The Canadian Minister of Trade and Commerce has ap-

plied for thirty booths at the next fair. A few of these will be used for Government exhibits, but most of the booths have been placed at the disposal of the Canadian Manufacturers' Association for allotment, and application for space should be made to that Association. The Department will pay for the booths and also the freight on exhibits from the port of embarkation to Lyons.

This is an excellent opportunity for Canada to display what she can furnish to help re-build war-wasted France and at the same time improve our national financial standing. Canadian manufacturers should co-operate with the Department of Trade and Commerce to "get the business."

Hamilton Radial Wants Higher Rates

The Hamilton Radial Railway Company, a subsidiary of the Dominion Power and Transmission Company, operating between Hamilton and Oakville, discontinued service on December 13 beyond Burlington Beach, two and a half miles away from the town of Burlington. The company issued a statement some time ago that, to enable them to continue operating without loss, it would be necessary to secure an increase of approximately 50 per cent. in revenue. The Dominion Railway Board, after hearing the case of the town of Burlington, ordered the Hamilton Radial Company to provide an adequate service under the terms of the agreement, by which they secured right-of-way through the town. This order, however, the company finds itself unable to carry out. The whole matter seems to hinge on the failure of the municipalities to understand why the Radial Company should seek to break agreements made, apparently, in good faith. They have not taken into consideration that rates computed in normal times are totally inadequate owing to the present high operating cost. Sir Henry Drayton advised a course of action whereby the municipalities agree to an adoption of the company's proposed scale of rates, but for some limited period—say two years, at the end of which time the original by-laws and agreements would become fully effective again. The intervening time would allow for a complete investigation into the company's operating expenses and there would then be no uncertainty as to the proper course of action. At the time of going to press the matter is still undecided and the company's lines idle, the towns affected being Burlington, Pine Grove, Bronte and Oakville.

The Toronto "World" is particularly incensed that the Hamilton Radial Railway Company seek to increase their fares by about 50 per cent. The "World" forgets to mention however, that the same conditions made necessary an increase in the price of the "World" of just 100 per cent.

Montreal Electrical Luncheon

Mr. A. R. McMaster, K.C., M.P., spoke on the League of Nations, at the Montreal Electrical Luncheon, on December 11. He is a strong believer in the league, and dealt with its objects, the difficulties in the way of its formation, and the grounds for hopes of success if formed. In a singularly clear, well reasoned address, Mr. McMaster traced the recent steps taken in the States to promote the formation of the league—a league to enforce peace, so that a nation should not issue an ultimatum or mobilize troops before placing the questions at issue before an international tribunal. The greatest difficulty was as to whether Germany, notwithstanding her very black record, should be included.

After quoting many British statesmen in favor of her inclusion, Mr. McMaster argued that Germany would be a greater danger if excluded than if she were included, for the

reason that outside Germany would be able to take advantage of any dissension between the other nations, and differences of opinion would inevitably arise. But if Germany was to be included, it must be a repentant, democratic Germany, willing to show the way down the hill in the matter of armaments. In his opinion, the trial of the Kaiser before an international court would clarify the situation. Another difficulty was the national pride of the nations. The idea that a nation would be willing to cut down its armaments and also abandon the right to make war until the questions at issue had been placed before an international court was against national pride. In his view, the great hope for success of the league was founded on the terrible destruction wrought by the war and the chaotic conditions which now existed among the Central Powers.

The Electric Club of Toronto

Before the Electric Club of Toronto on December 20, Dr. C. D. Howe, Associate Professor of Forestry in the University of Toronto, gave a most interesting address on the subject "The Forests of Canada." The speaker endeavored to remove the false impression which he believed was held by the majority of Canadians, that our timber resources are practically inexhaustible, pointing out that the total area of timber land was only in the neighborhood of 400,000 square miles, of which probably one-half had been destroyed at one time or another by fires. It was pointed out that one fire does not necessarily entirely destroy a forest, but that subsequent fires gradually destroy the possibility of these forests, re-seeding themselves and that inasmuch as we had taken very little trouble to prevent the recurrence of fires, most of this area that had been burned over had failed to recover and so was a total loss.

The professor pointed out that much of the cost of destructive forest fires could be placed at the door of those who were responsible for the appointment of the men in charge of the fire fighting organizations. These men for the most part were inefficient and only held their positions as a result of government influence.

The condition with regard to the number of years required to re-forest with the various types of trees, the susceptibility of many trees to disease, and other conditions which up to the present time have not been studied to any extent, were outlined by Dr. Howe. He concluded with the hope that in the near future he would be able to address the Electric Club again and explain that steps had been taken to remedy many of the evils at present existing and which were destroying one of the most important of Canada's heritages.

The first meeting of the New Year will be held on January 10.

Lignite to be Ready in 1920

The Lignite Utilization Board, composed of Mr. R. A. Ross, consulting engineer, Montreal; Hon. J. A. Sheppard, Moosejaw; and Mr. J. M. Leamy, provincial electrical engineer for Manitoba, has reported to the Council for Scientific and Industrial Research that there is a vast quantity of preliminary work to be disposed of before there can be any actual commercial output of briquetted lignite from the projected demonstration plant in Saskatchewan. Before proceeding with the purchase of machinery and the construction of the plant the Board estimates that six to eight months will be devoted to an exhaustive study of carbonizing and briquetting methods; six months will then be required for arranging plant lay-out and purchasing machinery, and six more months for commercial adjustment and initial operating stages. By the spring of 1920, therefore, it is anticipated the plant will be in full operation.

Wonderful British Naval Construction — One Destroyer a Week Since August 1914

The public knew from the various speeches delivered by Sir Eric Geddes and his predecessors at the Admiralty that very considerable additions have been made to the floating strength of the British Navy since the outbreak of war, but for obvious reasons little or nothing of a definite nature could be published in regard to this subject. Even now, when the ban on such publicity has been entirely removed, an appreciable period must elapse before it will be possible to describe in detail the process by which the British Navy has, in the past four years, attained a degree of strength such as it never previously enjoyed. Notwithstanding war losses, which have been far from light, the Navy to-day is considerably stronger, both relatively and absolutely, than it was in 1914. The heaviest losses have been suffered by types which were already regarded as obsolete, e.g., pre-Dreadnought battleships and armoured cruisers, and which, in consequence, did not call for replacement. Among the first-line capital ships our losses have been surprisingly light, considering the number of these vessels and the hazards they were compelled to run. Of the all-big-gun battleships, only two have been officially posted as sunk—the Audacious, destroyed by an internal explosion in July, 1917. In addition, three battle-cruisers, the Queen Mary, Indefatigable, and Invincible, have disappeared from the list, all three being sunk at the Battle of Jutland. New construction, however, has proceeded on such a large scale that, besides replacing these five vessels, we have an addition of five capital ships to the Grand Fleet.

Almost immediately after the outbreak of hostilities it was realized by those in authority that the naval campaign would be of such a character as to necessitate the employment of special types of fighting craft in which the Navy was conspicuously weak. In the past our naval construction policy had been based on the supposition that the command of the sea depended, in the first instance, on the numerical and individual superiority of our capital ships. The principle was perfectly sound, and has, indeed, been abundantly vindicated in the course of the war, but in the opinion of some judges it was pushed rather to an extreme length in pre-war days. At all events, it is quite certain that our early operations were handicapped by the shortage of light cruisers, destroyers, and certain special types which had not been multiplied on a scale commensurate with the expansion of the battle fleet proper. Even before the submarine menace made its appearance, the demand for destroyers was greatly in excess of the material available; and when in due course the submarine danger became acute, steps were at once taken to accelerate the output of destroyers by every possible means. The time has not yet come to subject our naval policy since 1914 to a searching investigation, but it is permissible to observe that the Admiralty's decision to lay down a number of heavy battle-cruisers, monitors, sloops, etc., at a period when destroyers were the crying need, has been severely censured by critics of unquestionable authority. These larger vessels monopolized a great deal of labor, plant, and material, with the result that for some time the production of destroyers was seriously retarded. At a later date this policy was modified, and, on the whole, the output of naval material during the war has been eminently satisfactory. The private shipyards throughout the United Kingdom have in every case proved worthy of their great traditions. Although rapidity of construction was the prime need, the high standard of workmanship characteristic of these establishments was well maintained, and it is safe to say that the workmanship of the vessels launched during the war has left nothing to be desired.

The naval material completed since July, 1914, may be

summarized as follows, the figures, though approximately correct, being quite unofficial: Eight battleships, five battle-cruisers, twenty light cruisers, 148 mine-sweeping sloops, sixteen large monitors, nineteen small and twenty-three river monitors, 190 destroyers and over 100 submarines. To the foregoing must be added many auxiliary craft, including whalers, "P" boats, large oil tankers, and 500 motor launches, the latter mainly of American construction. From the technical point of view, perhaps the most interesting, because the most novel, naval types built during the war are the so-called "hush hush" cruisers, a bold attempt to combine extraordinary speed with great gun power. We shall await with interest the revelations of how these mighty cruisers have acquitted themselves in service, and whether they have proved sufficiently useful to justify their high cost, not only in money, but in labor and material, at a time when both factors were almost priceless. As we pointed out last year, when M. Tardieu, a French naval critic, was allowed to publish a general description of their features, these ships complete a cycle of naval architecture which began forty years ago with the launch of the Italia and the Lepanto, when Italian constructors set the pace in the building of relatively huge vessels, with high speed, powerful armament, and moderate protection. As an indication of British shipbuilding and marine engineering capacity, the statistics relating to destroyers are very suggestive. Roughly speaking, we have completed one destroyer a week since August, 1914, in addition, be it noted, to a large programme of other construction, including nearly 150 sloops, numerous cruisers, monitors, submarines and auxiliaries, to say nothing of the mercantile production, which, despite the critics, has been very far from negligible. The magnitude of this shipbuilding achievement is enhanced by the fact that a modern destroyer is rarely less than a thousand tons in displacement, and has a speed of more—in some cases of far more—than thirty knots. The British shipyards and marine engineering ships have every reason to be proud of their war record. Hitherto, the public has necessarily been debarred by the censorship from learning what these allied industries have done to maintain that naval supremacy to which, in the main, we owe the triumph of our cause. Now that the restriction on publicity is at end, it is fitting that their incomparable services should be made known and worthily acknowledged.—The Engineer.

Economies Produced by Skip-Stop Service

A report has been prepared by the United States Fuel Administration, setting forth facts as to the real economies produced by operating cars on the skip-stop system.

Skip-stop service involves a reduction in the number of stops made, and theoretically there should be saved the amount of time previously lost in the stops thus eliminated. If, however the schedules are not revised to compensate for the eliminated stops there will be a natural tendency for the motorman to accelerate and brake his car more slowly than before, and both motorman and conductor will tend to permit the stops to be extended in length. In order to get the full advantages of the skip-stop plan, therefore, car operators should use the maximum rates of acceleration and braking with the minimum duration of stop which are possible with due regard for the comfort and safety of the passengers. Time saved in reducing the accelerating, braking and stop periods can be utilized in increasing the schedule speed, or it can be added to the coasting interval, or it can be divided, part being used for each. To demonstrate the relation between schedule speed, energy consumption and stops per mile the accompanying curves have been prepared covering two rates of acceleration and braking. These curves

are based upon data for a 20-ton car geared for a maximum running speed of 25 m.p.h. Acceleration and braking rates are assumed first as $1\frac{1}{2}$ and then at 2 m.p.h.p.s., and the car is assumed to be operated at maximum schedule speed with five-second stops. The friction with power on is taken at 20 lb. per ton and for coasting at 25 lb.

When the car is accelerated and retarded at the lower

CURVES SHOWING RELATION OF SPEED, ENERGY CONSUMPTION AND STOPS PER MILE AT TWO RATES OF ACCELERATION AND BRAKING

rate the energy consumption is greater than when the higher rate is used. From the curves the following table has been prepared to show the relation of values in the two cases:

Stops per mile	Watt-hours per ton mile $1\frac{1}{2}$ M.p.h.p.s.	Watt-hours per ton mile 2 M.p.h.p.s.	Ratio in per cent.
3	92	78	84.5
5	114	95	83.
7	134	108	80.6
9	150	118	78.7

The reason for the smaller energy consumption with the higher rate of acceleration and braking is that the motorman operates for less time on the resistance points of the controller. There is also less energy dissipated in the brake-shoes as well as in the resistors.

It is suggested that all railways might advantageously post in conspicuous places, where they will be seen by train crews and company officials, statements of the total amounts of energy used during the preceding week, with the car mileages and energy consumptions per car-mile, and with comparisons of past records to permit the checking up of the effect of the instructions issued to train crews and others. Some railway systems have their power lines sufficiently subdivided as to make records available for individual lines and thus to permit records to be compared. Comparison between divisions will usually result in personal and divisional rivalry.

The practice of checking operators as to rate of acceleration and braking used, and as to their success in reducing duration of stops to the minimum, cannot be too strongly advocated. The most systematic way of doing this is with the aid of some form of checking instrument. Verbal instructions, printed rules and other educational work require a relatively large amount of effort and do not accomplish the results which can be obtained with the aid of some such device. It is reported that 98 per cent. of the cars in Great Britain have for the past fifteen years been using some form of checking device. In America we probably use instruments of this character on fewer than 70 per cent. of our cars. Records show that by using these devices, with proper follow-up systems, it is possible to save at least 15 per cent. of the power consumption. Theoretical savings are from 20 to 25 per cent., but in actual practice somewhat less is expected.

The Relation Between Light Curtailment and Accidents

By Mr. R. E. Simpson*

From the published statistics of a number of states, together with conservative estimates for the remainder, we find that approximately 25,000 persons are killed or permanently disabled, 500,000 seriously injured, and 1,000,000 slightly injured, each year. Translating these figures by means of the accident severity rates we have a total of 180,000,000 days of lost time. This is equivalent to the loss of the services of 600,000 men for a full year of 300 working days. The economic loss is distributed over the entire country during a period of one year, and for that reason its effects are not so keenly felt, or its importance recognized. If, however, this loss were concentrated on any one of our basic war industries, as for example, shipbuilding, steel making, munition manufacture, or coal mining, it would be nothing short of a national calamity. Even distributing this loss among the four industries named would seriously cripple all of them.

It is apparent that we have here an important factor touching on the supply of labor, and anything that can be done to curtail this economic loss is worthy of careful consideration. There is a certain percentage of unavoidable accidents—that is, man's provision is unable to cope with unknown factors, and this is especially true of pioneer work. The best that can be done is to profit by experience, and endeavor to prevent the knowledge and experience thus gained from lagging behind practice. A large percentage of accidents may be classed as avoidable in the sense that the application of mechanical safeguards and the observance of safety rules will prevent them. Anything in the form of a practicable guard, of safety education, or of safety regulations that will protect the worker from injury should be welcomed by the plant manager to-day. Past investigations have indicated various influences on the causation of accident, and prominent among these is industrial lighting.

A survey of 91,000 accidents from the records of The Travelers Insurance Company for the year 1910 showed that 23.8 per cent. were due to improper or inadequate illumination. Bearing in mind the progress in the art of illumination during the past eight years, it is hardly possible that this percentage prevails to-day. New factories are lighted by up-to-date equipment, while many old plants have had their lighting systems brought into conformity with modern practice. These are steps in the right direction, and are bound to be reflected in the accident rate. Offsetting this, to a certain extent, is the practice of many plant managers of substituting high efficiency lamps, without providing adequate reflector protection. Notwithstanding the vast amount of expert advice that has appeared in the technical journals devoted to specific industries, there are literally thousands of plants that have not profited by this advice. The directing personnel of these plants, from managers to sub-foremen, do not seem to appreciate the difference between light and illumination, between a reflector and a wire guard.

18 Per Cent. of Accidents Due to Poor Lighting.

There is some foundation, however, for assuming that 18 per cent. of our industrial accidents are due to defects in the lighting installation. On that basis the services of 108,000 men for one year are lost annually, because the illumination provided is not adequate for the safety of the workers. That

this condition should exist year after year is all the more reprehensible because of the fact that the remedy is so easily applied and has beneficial results in many ways other than in the element of safety involved. Accidents caused by carelessness, inattention, or ignorance can be eliminated only by a long continued, painstaking educational campaign often involving a change in long established habits. The elimination of accidents due to inadequate or improper lighting is simply a matter of purchasing approved equipment and installing it under competent direction. In fact, it seems proper to include illumination in the list of mechanical safeguards, for the reason that the lamps and reflectors provide the guard—illumination—to point out the hazard, just as effectively as a railing points out the danger of and provides protection against the hazard of a revolving flywheel. The sum involved is insignificant when compared with the accident claims, or the lost profit on the product of the labor, or the value of the product itself.

Many Improper Installations.

Anyone who makes an extended survey of the lighting conditions of our industries will inevitably be impressed by the much larger percentage of improper installations when compared with the inadequate installations. This is due primarily to the praiseworthy, but none-the-less ill-advised, attempts to better the plant illumination on the basis solely of providing a greater candlepower output. The questions of distribution, diffusion and absence of glare are either not fully appreciated, or are entirely unknown, and therefore do not receive proper consideration. Now if the persistent efforts of several years have not wholly succeeded in educating the factory managements in the fundamentals of good illumination, is it not absurd to expect intelligent application of hurriedly promulgated rules for light curtailment? This in itself should be a sufficient argument against any such action, and it is rather gratifying to learn that there will be no general request for diminishing industrial lighting.

The saving in coal by curtailment of industrial lighting would be negligible when compared with the ultimate economic loss. If, for example, the full year's labor of the 108,000 men that is lost annually, due to poor illumination, could be saved and applied to coal mining, 130,000,000 more tons of coal could be produced. To provide ample illumination for the safety of these workers, ten hours a day for a full year, would require less than 10,000 tons of coal. We may convert this fact into a more detailed and concrete form by saying that a 25-watt lamp burning ten hours a day will provide adequate illumination on a stairway for one year by the use of one-eighth of a ton of coal. By dispensing with the lamp one-eighth of a ton of coal will be saved, but if during the year one accident occurs involving the loss of only one day's time the economic loss from a coal producing standpoint would be sufficient to operate the lamp 32 years.

More Accidents on Dark Days.

This brings us up to the point of considering the effect of diminished lighting at places where such reduction is almost invariably found. Stairways, elevated gangways, passageways, and storage spaces are generally inadequately lighted, and are the first to suffer from a policy of light curtailment. The hazards associated with these poorly lighted

*From a paper presented at the recent annual convention of the Illuminating Engineering Society.

sections of our industrial plants have been portrayed many times. Confirmation of these hazards has been given by the report of the British Government survey of industrial accidents showing that 40 per cent, more men are injured from falling and stumbling in the winter months than in the summer months. This is exclusive of street slipping accidents. The physical condition of the stairways and passageways is the same for both periods, the sole difference being in the illumination.

Many accidents occur in storage places due to inadequate illumination, but this fact is not often brought out in the reports. Raw material and finished product are often piled in uneven tiers, and these fall over at inopportune moments. Carelessness is very often the contributing cause, but in many cases a conscientious worker will pile material unevenly simply because the illumination is not sufficient to show him that the tier is out of alignment. Similarly, in storing tools or small parts on shelves some are placed too near the edge and fall on the workmen. A case in point is that of a young man who was storing small diameter steel rods. Unnoticed by him, one of the rods protruded a foot or more beyond the edge of the shelf, and in passing this point later on he received a jagged cut along the side of his head. There was a small-sized lamp in the central aisle, but none in the side aisle where the accident occurred.

Badly Lighted Passageways.

Even the supposedly well lighted working spaces in some shops are not immune from accidents of this nature. A certain work bench was well illuminated by local lights with proper reflectors, but the bench cast a shadow on the floor while the general illumination was not sufficient to offset the shadow. There followed a sequence of accidents due to the toppling over of partly finished work piled in the shadow. With a higher intensity of general illumination, accidents of this type were largely eliminated. Passageways that are traversed infrequently hardly justify the continual use of an illuminant, unless there is exposure to moving machinery or other hazards. Irrespective of the danger element, all passageways should have lighting units so installed that they can be turned on and off at either end. The lack of such a provision was partly the cause of an accident to a carpenter who had been called in to make some repairs in a chemical establishment. A cup had been placed to catch the drip from a slight nitric acid leak until repairs could be effected. The carpenter, assuming that the cup was placed to catch oil drip poured some of the acid on his saw and then rubbed it with his hand. Before neutralizing agents could be applied the palm of his hand was badly burned. It is evident that if proper illumination had been provided the carpenter would have noted that neither the color nor the consistency of the acid corresponded to that of an oil that might appropriately be applied to a saw.

A method is open to plant managers by which, at the same time, coal will be saved, better illumination provided, and accident hazards reduced. It consists in the universal use of reflectors. Every plant manager (as part of his lighting policy) should adopt the principle of a proper reflector for every lamp. In the field of general illumination, the use of unshaded lamps, in connection with naturally dark walls and ceilings, or with white walls and ceilings that have become dirty, is not only wasteful and inefficient, but also increases the accident hazard from bright light sources. Proper reflectors would bring this wasted light under control, and at the same time reduce the accident hazard. In a limited number of cases smaller lamps could be substituted and still ample illumination would be provided; but for the most part reflectors should be used with the lamps now installed to bring about a much needed improvement.

In the field of local lighting there is much more room

for saving and improvement. There are thousands of 120-watt carbon lamps, and many more thousands of 60-watt carbon lamps, used for local lighting about machines. It is the exception rather than the rule to find these lamps equipped with reflectors. Wire guards are more popular. For purposes of illumination a 15-watt or 25-watt tungsten-filament lamp with proper reflector would prove adequate. The question of serviceableness or of breakage of this lamp over the carbon lamp is dependent on local conditions. The recent agreement between lamp manufacturers and the Fuel Administration insures a reduction in the use of carbon lamps. In enforcing this policy, lamp users should be warned against employing tungsten-filament lamps without reflectors. Exposure to the high intrinsic brilliancy of the tungsten filament involves a greater degree of vision impairment than with the carbon lamp. Wire guards will not serve, for although they protect the lamp from breakage to a certain extent, they afford no protection to the eye. The lamp can be replaced for twenty-five cents, but the eye—vision—ininitely more valuable, cannot be replaced at any price.

During a recent inspection we noticed a workman at a stamping press who persistently stood at one side of his machine. In answer to our inquiries the workman stated that he could not see unless he moved to the side and closer to the lamp; and he also informed us that he was going to get a "big tungsten lamp." He was working on large tinned sheets and while standing in front of his machine a dazzling reflection was directed toward his eyes. A simple adjustment of his local light changed the angle of incident and reflected rays, and thus removed the trouble.

This incident is more or less typical. There is so much unintelligent use of light in the form of unshaded or improperly placed lamps that we are fast approaching the state of being a nation of eye-glass wearers. An important remedial step will be taken when we whole-heartedly get behind the movement of "a proper reflector for every lamp."

Discussion.

Chester C. Rausch, Assistant Director, The American Museum of Safety: There are two outstanding features concerned with the use of electric lights in illumination for the factory or other purposes. First, the almost universal tendency of those concerned in the maintenance of such equipment to allow it to become filthy with an accumulation of dust or smoke, particularly the reflectors; then when this condition has become intolerable, to attempt to relieve it by the addition of high candlepower lights or the removal of reflectors, or both. The eye-strain resulting from the exposure on any portion of the eye retina of the light from a modern high power nitrogen light is sufficient, in many instances, to cause momentary blindness when the eye is turned away from that source of light. Where such lamps are used in the vicinity of the point of operation of any machine, there exists the almost certain possibility that eventually an accident on that machine or device will result. The use of proper reflectors in such cases should be mandatory.

The loss of illumination due to the coating of reflectors with dirt may result in a loss of light equal to 60 per cent. or more, before attention is given to the fact that they need cleaning. The results where systematic cleaning of all reflectors and equipment has been followed, show a reduction in current consumption that, in many cases, has not only eliminated the need for additional installations of lamps, but has even reduced the necessity for using those already installed.

Many owners concerned with the maintenance of illuminating equipment complain that the cost of systematic cleaning is great, but such an argument can scarcely stand against the evidence repeatedly shown that accidents occur where illumination is poor on any one of the several points of quantity,

intensity and diffusion. The proper installation of lighting equipment with reference to galleries, windows or other means of reaching the lamps, when fixed, or by the replacement of fixed lamps with those which may be lowered readily, disposes of this objection. That there is a direct relation between poor illumination and accidents is shown by a comparison of the number of accidents that occur during the course of the year when artificial light is used to supplement natural light in a portion of the working period, and where natural light is sufficient for all illuminating purposes. A "Study of Accidents for the Year 1917" of the Portland Cement Association, shows the percentage of total accidents for twenty-four hours, ranging from as low as 7.3 per cent., between 12 and 1 p.m., to as high as 13 per cent., between 5 and 6 p.m., double. A similar frequency is also noted between the winter months; and the two, those for the hours of the day and for the months of the year, coincide almost exactly.

It takes only a casual observer without any technical training whatever to observe the enormous difference in the illuminating effect obtained in shops where the walls are kept smooth and clean and of light color, as against those where the opposite conditions prevail. One has but to recall his own experience in two rooms in his own home, in one of which everything is of light color, and in another of dark color; or of conditions that prevail when snow is on the ground, and when the ground is bare and bleak, to remember that even when it is supposed to be dark, the ability to get about is greater under the lighter conditions than under the dark.

When manufacturers and others whose places of employment or work require illumination learn that less light properly distributed through fixtures properly maintained costs less for current consumption, a long step will have been taken in the matter of illumination; but when, coupled to this, they can be convinced that the number of accidents is proportionately less, we will approach more nearly desirable illumination.

Less Than 5 Per Cent. Use Best Practice.

A. J. Sweet: Probably less than 5 per cent. of our industries represent in their lighting practice a close approximation to the best practice attainable in the present state of our knowledge. An additional 25 to 45 per cent. of our industries have made a good beginning toward providing adequate lighting, though their practice falls far short of the attainable ideal. The remaining one-half to two-thirds of our industries are characterized by grossly inadequate lighting.

It may be conservatively estimated that, in this year A. D. 1918, the application throughout American industry of our best present knowledge in the lighting field would result in a 15 per cent. increase in industrial production.

Consider what such an increase means. It is equivalent to the production of an army of approximately one and one-half million workers; an army that consumes neither food nor clothing nor wealth in any form; an army that produces without additional factory buildings or machinery or tools; an army that gives at least two-thirds its wages to be divided between capital and labor.

Moreover, such improved lighting means a material decrease in spoilage resulting from imperfections in workmanship. Such spoilage varies so enormously as between different industries and between different industrial operations that it is impossible to estimate its total in American industry with any degree of accuracy. It is safe to say that the decreased spoilage made possible by adequate lighting throughout American industry represents an annual net value of not less than \$100,000,000. In terms of labor, this represents an army of not less than 100,000 men.

It should be emphatically pointed out that such "best lighting practice" involves a great deal more than the suffi-

cient and proper quantity of light. It involves light of the proper quality, particularly with respect to diffusion. It especially involves the highly important consideration of the direction of the light rays with respect to the plane of the work. Sometimes the elimination of sharp shadows, sometimes the avoidance of such elimination, exercises an important influence upon the efficiency of industrial work. The proper screening of the light sources, to the end of attaining conditions under which eye fatigue is reduced to a minimum, is still another factor of large importance.

In short, the attainment of "best lighting practice" is a complex technical problem requiring for it fully adequate solution the services of the competent lighting specialist. The failure to recognize this is one of the factors retarding proper practice in the industrial lighting field. It is very difficult to convince the average industrial manager that he is not fully competent to decide his own best lighting practice, to solve his own lighting problems.

Staggered Hours of Closing

As a means of smoothing out the load curve, staggered hours for closing seem to offer very great promise. A recent investigation made in Boston showed that at least 15,000 kw. in generating capacity would be saved on the system of the Edison Electrical Illuminating Company if 30 industrial establishments would change their working hours by thirty minutes. This statement was made at a recent meeting of the Boston section of the A. I. E. E., by Mr. L. L. Elden, electrical superintendent of the company. Fifteen thousand kw. represents about one-sixth of the total estimated peak load of the Boston system for the coming winter, and the comparatively small change in closing hours required to realize such a large increase in available capacity is something of a surprise.

The Biggest Water Power Merger

The Niagara Falls Power Company, the Cliff Distributing Company, and the Hydraulic Power Company of Niagara Falls have been consolidated into a new corporation under the name of the Niagara Falls Power Company thus creating the largest electric power company in the world in point of energy output. Including the plant of its subsidiary, the Canadian Niagara Power Company, the company has an installed capacity of about 370,000 h.p. and is installing an additional 100,000 h.p., to be ready for operation during 1919, making it the largest and most important power installation in the world. It is proposed to substitute for one of its present 100,000-h.p. plants a new 200,000-h.p. plant.

The British Navy 99.99% Efficient

The statement was made on Trafalgar Day in London that the British Navy has carried, by means of its transports, 16,000,000 fighting men and the casualties amount to one man in every 10,000. The safety of the legions of overseas and American troops has rested with the Navy. That and the Mercantile Marine through their vigilance and efficiency have made the victories of the past years possible. They have fed and clothed the army in Saloniki and have kept England so well supplied with food and raw materials that no really serious lack has been felt.

Public Ownership the Obvious Policy for Electric Railways

By Richard McCullough*

The obvious remedy for the perils which now confront the electric railway industry is public ownership. It is the purpose here to analyze the situation and indicate the advantages of public ownership at present to both the public and the investor.

Old-Style Franchises are Valueless

In recent years one of the great difficulties has been to obtain franchises of sufficient duration to enable the companies to borrow necessary capital at the lowest rate of interest. As a matter of fact, under modern utility control, a franchise is merely a permit to lay tracks on certain public property, the service and equipment being determined from time to time by a commission. Nevertheless, franchises have heretofore been associated in the public mind with great value, and this impression persists. There has always been more or less opposition to new long-term franchises or extensions.

Under public ownership the necessity for franchises immediately disappears, and the rate up on which money may be borrowed, with the city's credit, would be much lower than that at which private corporations, with short-time franchises, could obtain the same money. The return which municipal authorities would claim on securities issued by them would be 2 or 3 per cent. lower than that demanded by private investors, and also much lower than the rate of return now termed reasonable by public service commissions. One of the greatest advantages to the community in public ownership lies in this lower rate upon borrowed money. The saving thus made in the fixed charges would be great enough to answer the claim frequently made that there might be losses due to wasteful and extravagant management under public ownership.

Service Question Would Be Solved.

Under public ownership the character of equipment and the kind of service can be determined by the people themselves. They can have exactly the service they wish to pay for. The familiar protests against the crowding of cars, antiquated equipment, infrequent service, restrictions of transfer privileges and poorer service than in other cities will then come back to the car riders themselves, and the remedy is obvious.

People can ride in discomfort or in luxury, according to the bill which they are willing to pay. It is entirely probable that under public ownership the community would be satisfied with the service simply because it was public service. They would feel that any necessary curtailment of service was for the common good and not for the benefit of the absentee landlord. Witness the absence of complaint regarding the steam railroad service now operated by the national government.

Under public ownership many reforms such as skip stops, train operation, staggered hours of business, short routing of cars, readjustment of routes, police co-operation in keeping tracks clear, and other aids to cheap and quick transportation, difficult to obtain under private ownership, would be immediately introduced.

One of the lessons taught us during our war experience

has been the economic waste due to useless competition. The electric railway is the most economical intra-urban carrier, and under public ownership there would be no congested streets on account of jitneys, buses and other competitors. The private automobile owner might also be restricted in his now unquestioned right to use the city streets for storage purposes, if it was found that such use interfered with rapid transit on the city's street car lines.

Wage Adjustments Would be Simple

One of the most difficult problems, especially during the last year, has been the adjustment of wages. Whenever disagreements have arisen between electric railway employees and the companies, great pressure has been brought to bear on the companies by municipalities, merchants, chambers of commerce, and in some cases by the state and national governments to adjust wages so that there would be no cessation of work. The adjustment of wages has usually consisted in a horizontal increase far beyond the financial ability of the companies. Even where the authorities, readjusting the wages, have advised an increase in fare to compensate for this wage increase, it has been difficult for the companies to get the consent of the proper authorities. Contracts have been cited, legal obstacles raised and other difficulties put in the way of the companies.

Under public ownership, wages would be a simple matter to adjust. Precedents already exist in the wages of firemen and policemen. It is a well-known fact that the pay of street-car men at present is greater than that of the corresponding class of city employees. It is entirely possible that public ownership might lead to lower wages, and in a business where 50 per cent. of the operating expenses consist of wages, a lower wage scale would be an important factor in keeping down the cost of operation.

One of the frequent sources of contention between electric railways and municipalities has been the constant pressure brought upon the companies to extend lines into undeveloped portions of the city and adjoining territory. The usual argument advanced is that the extension will soon build up the new territory. Railways know from long experience that any extension increases the average length of haul, and that these extensions will probably be operated for many years at a loss before the territory is sufficiently well built up to produce enough riding to pay the expenses of operation.

This argument, however, does not appeal to the usual local improvement association or to the eloquent real estate promoter. Under public ownership, municipalities would have this matter entirely within their own control. They could build the proposed extension and make the car rider pay for it, or they could require a subsidy of the real estate owners sufficient to pay the cost of the extension in whole or in part, or for a term of years until the extension took care of itself.

The same methods could be used in connection with the building of rapid transit lines and terminal facilities, which are too expensive to be undertaken under private ownership. It is well known that the great gain due to rapid transit lines is in increased land values, which are reflected in the tax assessments and not in revenue to the

*President United Railways, St. Louis, Mo., before Electric Railway Association

railway. In case of public ownership the burden of building extensions and rapid transit facilities could be put where it belongs.

Taxes and Fares Easily Adjustable

The question of taxes has always been a disputed point in connection with the operation of electric railways. Most companies feel that they are overtaxed, while often the general impression in the community is that they are not sufficiently taxed. Under public ownership the city or the state itself could adjust the tax question as it chose. It could either abolish special taxes and have lower rates of fare, or it could use the car riders to collect taxes and have higher fares.

This brings us to the question of rates of fare. It is difficult to see how electric railways, under private ownership, can ever afford to return to a 5-cent fare, even if their other burdens are lifted. But under public ownership the rate of fare could be established at 5 cents or less, and the deficit in the cost of operation made up out of the general taxes. Under an extension of this theory to the limit, street car riding could, if so desired, be made free, the cost of operation being spread over the entire community. This plan, I believe, was once proposed by Tom L. Johnson of Cleveland, who argued that inasmuch as the owner of a public office building provided free elevator service for his tenants, why should not a community provide free street car transportation for its inhabitants?

If the city chose the other alternative and used the street car system to assist in the collection of taxes, the rate of fare could be adjusted from time to time to produce the revenues required by the city, either in whole or in part. This would be an extremely simple method for the collection of municipal revenues and would reach many of the people who now pay no taxes at all.

The argument that has frequently been urged against public ownership of electric railways is the fact that the city would take over a large number of employees who might be developed into a political machine. All cities, however, now have more employees on their payrolls than they have electric railway operatives. All American cities have their own fire and police systems, employing much the same class of men as are now employed by electric railways. There has never been any great scandal over the use of firemen or policemen as a political machine. All the large American cities now operating their own water systems involving large investments and a large number of employees. The electric railway system, next to the water system, is probably the closest to the community and is vital to the health and happiness of the inhabitants of the city.

There has been a feeling that electric railway problems are so difficult and concern the welfare of each citizen so intimately, that no municipal administration could attempt to solve these problems with any prospect of re-election. We must not overlook, however, the large numbers and the powerful political influence of electric railway employees and their friends, who would no doubt rally valiantly to the aid of any administration which was fair in its treatment of them and which seriously attempted to solve present-day transportation problems, no matter how deeply the municipality might become involved in expensive experiments. We must not delude ourselves into imagining that public owners just like private owners can evade facing the demands for rapid transit, better equipment, denser service, a seat for every passenger and lower fares. Public owners must face these problems boldly, however, and in attacking them make use of their self-evident advantages.

Making Public Ownership Effective

With this brief statement of the advantages of public ownership from the standpoint of the people, the next ques-

tion is how may it be put into effect. This may be done:

1. By any outright purchase of the electric railway system by the public at an agreed valuation.
2. By an assumption by the public of the securities of the railway, with an agreement to pay interest on these securities.
3. By an exchange of municipal or state bonds for electric railway bonds, and an agreement on the part of the public to pay an agreed return upon the stock.
4. By any combination of these three methods.

The first method, that of direct purchase, is the most simple and the most desirable from the standpoint of both parties. Investors, of course, will insist that if their property is taken over as a going concern, the public must not be niggardly in its treatment of the elements which unite to form the value. These investors have worked and worried and risked all for the purpose of keeping up with a rapidly progressing art. They, more than any other agency, have been responsible for the development of the modern city, and in dealing with them the cities should take all this into account.

If the public chooses the other alternative and assumes the interest on the securities of the railway until such time as these securities may be purchased or amortized, the scheme then becomes public control and private ownership. In this case investors will demand that the interest on their capital be guaranteed and that the investment be properly safeguarded until such time as the property is entirely purchased by the public.

Within the last year we have seen vast amounts of money raised within a few weeks by popular subscription, and there need be no fear that the public cannot raise the necessary money for the purchase of its electric railways. Securities issued by municipalities are popular, because investors like the tax exemption features, and these securities will be especially popular at this time because it is likely that the period of high taxation will continue for many years.

All things taken into consideration, there are great advantages in public ownership and there are no insurmountable obstacles to putting it into effect, if there is a disposition on the part of both parties to deal fairly with each other.

Taking over electric railways at this date, the public would have the advantage of interesting itself in an art which has been developed by private initiative. The public would reap the experience and technical knowledge which have been acquired over long years of experience and test by private investors. The public is in a much better position to take over this business at the present time than at any time heretofore. Equipment and methods have been standardized, working organizations have been selected and trained, and the whole industry can readily be taken over by the municipality or the state without any of the uncertainties which the public would encounter in developing a new business.

If we analyze the objections to public ownership of electric railways, it will develop that the only valid objection is the fact that public ownership of such enterprises is unusual and, in this country, untried. In the face of what we are seeing every day, however, this objection has no value. The unusual of to-day is fast becoming the commonplace of tomorrow. Electric railway executives should be the last to oppose public ownership. They will be accused of a selfish interest—a desire to hold on to their jobs. Our only real selfish interest is that of the investors. We should see to it either that they are protected in their investment, or that their principal is returned to them.

Application will be made to the next session of the Quebec Legislature for the incorporation of the Levis Trams-ways Company, with power to acquire the property and franchise of the Levis County Railway.

Features of Service-at-Cost Plan Franchise

A franchise which is unique and which possesses the necessary elasticity to make it valuable and effective when conditions return to normal has recently been put into effect in Cincinnati, Ohio. The franchise is the result of much study and wide investigation and is commensurate with the magnitude and importance of the undertaking. The contract, which embodies the most modern ideas of municipal control of street railway operations, is described by Mr. W. C. Culkins, director of street railroads, City of Cincinnati, in Electric Traction.

The proposed ordinance was studied out by a committee composed of the writer, the city solicitor, assistant city solicitor and two members of the council. When this committee submitted its report, they emphasized the fact that the need for relief both to secure adequate service and to properly compensate employes, was very real and pressing.

The new ordinance contains the following general provisions: A general transfer system; complete control of service and operation by the city; right of the city to re-route; authority of council to order extensions and establish new and additional routes; return to the company on its investment; franchise tax to be paid to the city; requirement that all leases, franchises, contracts, issues of securities or transfers of franchises be submitted to the city for approval; requirement of bond for faithful performance; privilege of police and firemen to ride free; rental of viaducts; amortization of the reducible debt; repayment of expenses of valuation and traffic survey; rentals; right of the city to purchase, either by condemnation or at the valuation agreed upon in said ordinance; and retention of routes as fixed in said ordinance.

Under the new ordinance the city, through the director of street railroads, may re-route cars at any time that it deems it advisable to do so.

Authority to Order Extensions

The old ordinance in force authorized the city to order extensions only under restricted conditions. The new ordinance gives the council absolute power to order extensions at any time, the only limitation being the inability of the company to sell securities by the usual method in the open market.

Control of Service

The old ordinance provided that the city might order improvements in service provided the cost did not impair the city or company's financial return. The new ordinance places no limitation except that the budget allowance has not been sufficient and this the city has the authority to increase by allowance for supplementary expenditures.

Rates of Fare

Reluctant as it was to consider an increase in fares, the committee was confronted with an abnormal situation due to the war, thereby increasing the cost of labor and material to such an extent that the Government has requested localities everywhere to deal with the problem of street railway fares in order that the best service possible be maintained.

The average operating expenses for the first five months in 1916 was 14.15 cents per car mile and including taxes and fixed charges the total was 26.11 cents per mile. For the corresponding period of 1918, operating increased to 18.36 cents per car mile and to a total of 32.23 cents per car mile, substituting for a surplus of 98 cents, a de-

ficit of 3.55 cents per car mile. A further comparison of the same periods showed that the total cost per revenue passenger had increased from 5.03 cents to 5.86 cents per revenue passenger, while the earnings per revenue passenger from all sources was substantially the same, 5.22. In this period of 1918 the company has been losing .64 cents on every passenger carried. This was due, not only to the increased cost of operation, but to reduction in the number of passengers carried.

In 1917 the cost of coal increased \$189,000, wages under contract \$95,000, maintenance and renewals nearly \$15,000, and other transportation charges about \$20,000, also taxes \$28,000, a total of nearly \$350,000. The conditions of 1918 show a further increase required of nearly \$500,000 for operating expenses and taxes, and an annual falling off in receipts of from \$15,000 to \$200,000.

It is not surprising that under these conditions the company was unable to issue securities for improvements and extensions or to maintain a credit necessary to obtain proper banking accommodations for the transaction of its business. In addition to this the committee found that the company was unable to pay a scale of wages to its employes comparable to that found in other industries. This obviously resulted in two things, the company could not offer sufficient inducement to retain enough men to operate its full service or to deal fairly with those who did remain. In this particular the condition of the local company does not differ materially from that of similar utilities in other cities, for the causes are national in their scope.

Fare Methods Considered

Consideration was given to various plans of fare collections, including the zone system, the flat fare, and the charge for transfers.

In the opinion of the committee the zone system, while presenting an equitable method of charging passengers in accordance with the length of haul, is novel in this country, presents difficulties in the way of adjustment to present equipment and would require considerable time to work out and therefore should not be undertaken at this time and under the circumstances when immediate relief is imperative.

In considering the charge-for-transfers plan it was ascertained that the total number of transfer passengers in 1917 was 39,578,158. This number at one cent would produce \$395,781.58, in itself not sufficient to meet the indicated deficit. Three factors were, however, considered. The records of the company showed a decrease in the number of passengers carried and also a decrease in the percentage of those passengers who used transfers, of from 39 per cent. in July, 1917, to 35 per cent. in May, 1918. In addition the charge for a transfer would further reduce the number of transfers used; therefore the income from this source would be very much reduced from the amount indicated in the statistics. It was clearly evident, therefore, that this plan would fail to meet the situation.

Service-At-Cost Plan.

It was consequently determined to retain the existing flat rate plan, but since the present revision covers a period ending April 22, 1931, and since the present war conditions are abnormal and unstable, it was the opinion of the committee that the fares should be based on a service-at-cost plan, by which they would automatically adjust themselves

to the varying cost of operation. Actual costs naturally vary according to all kinds of fractions of a cent and at various seasons and even hours of the day. It is therefore obviously impractical to have a rate of fare that will at all times represent exact cost of service, since it must vary with the cent or some practical fraction thereof, to be effected by the use of tickets. Furthermore, the changes on rates of fare cannot be made from day to day, but must vary by periods of a reasonable length.

In order to give stability to the plan and prevent inconveniences growing out of too frequent changes of fact, a reserve fund of \$400,000 was provided, into which shall be paid all surplus remaining after payment of operating expenses, taxes and allowed return to the company. This fund is under the direction and control of the city and is not to be used for any other purpose.

When the amount of this fund has reached \$250,000 above normal, it shall be prima facie evidence of the necessity of reducing fares to the next lower grade.

If the income is insufficient to meet the payments before mentioned, the reserve fund shall be used and should it be reduced to \$250,000 the fares shall be raised to the next highest grade, the decrease and increase to be at the rate of one-half cent each. The street railway company must provide the minimum of \$250,000 for this reserve fund.

Methods of Fare Determination

In arriving at an estimate for an initial rate of fare, an analysis was made of the finances of the company for five years prior to December 31, 1917, and for 17 months ending May 31, 1918. It was evident from the figures that any comparison with the pre-war period, such as would be taken under ordinary circumstances, would be of little value, since the abnormal situation is due to the entry of this country into the war, and it was the war conditions which must be met.

In 1917, taken as a whole there was an increase in the number of revenue passengers. However, an analysis by months showed these figures to be misleading. In the early part of the year passenger revenue showed a decided upward tendency until September. From that time there was a falling off apparently coincident with the leaving of the selects for cantonments and the call for labor at the shipyards and other large governmental industries. Operating expenses showed an upward tendency due to the rapid rise in the cost of material and supplies, especially coal, which became much more marked in the last four months. In April, 1918, the company found it expedient and desirable to make an increase of two cents per hour to its employes under contract and a similar increase to all other employes.

It will be seen, therefore, that not only were conditions in 1917 so entirely different from the pre-war period as to be practically incomparable, but these were further changed in many respects during the present year, so that further additional increases were necessary.

The company had taken the years 1916 and 1917 as a basis in arriving at estimates for the present time. It was believed, however, that the first five months of 1917 and 1918 would furnish a more reliable guide and comparisons were made with these periods in two ways.

The first is for the entire five months periods, but since it could have been argued that in the months of January and February there were unprecedented weather conditions, causing loss of passenger revenue and increase in operating expenses and that these should be eliminated, a second comparison was made of the months of March, April and May of these two years, as presenting a more normal situation.

From this data the net cost of carrying passengers was found to be 5.746 cents per revenue passenger. In arriving at this, provision was made for a 25 per cent. increase in

wages and for the additional freight charges on coal and other commodities ordered by the United States railroad administration.

The return to the company remains the same as in the previous ordinance, which was approved by a vote of the people, except that it was adjusted to cover the interest charges on notes for the purchase of new cars in 1917.

The initial rate of fare has been placed at 6 cents, and it is believed that the margin of 24 cents per revenue passenger will take care of any falling off of traffic due to the increased fare. As soon as costs of materials and supplies are reduced, a rate of even lower than 5 cents may become effective under the automatic plan, thus giving the public the benefit of the change without waiting until the end of the revision period.

The committee, in recognition of the 5 cent fare principle and as an incentive to the company to co-operate in the reducing of fares as soon as possible, provided that when fares are reduced to 5 cents the company may retain 45 per cent. of such surplus, the remaining 55 per cent. going to the reserve fund to further reduce fares. When fares are above 6 cents the entire surplus goes to the reserve fund, the company receiving no part of it. This fully meets the only objection raised against the service-at-cost plan, namely: that since the company is not affected by change in rates of fare there would be a tendency to indifference as to operating methods, throwing the burdens entirely upon the city to enforce efficiency. Under the plan presented, increased fares will always work to the financial detriment of the company, while the city has ample control over the service to prevent its impairment.

Plan New to Franchise Ordinances

In order to provide service-at-cost a city must be in a position to know that the cost is not excessive and that no improper or unreasonable charges have been made. Provision was therefore made for complete control over purchases, salaries and all other operating expenses of the company by a plan that is new in franchise ordinances. The company is required to prepare an annual budget, which must be approved by the city and all expenditures must be kept within the budget allowances and made only for the purposes therein provided. A supplemented budget may be filed for approval to meet emergencies. In addition the city has the power to disapprove the purposes of any voucher. There is approximately as much control over the financial operations of the company as the city would exercise over the utility if it were municipally owned. Provision is made for arbitration in case of a disagreement between the city and the company.

Working Capital Fund

A new provision in the ordinance is for the establishment of a working capital fund, which will appeal at once as essential to modern business operations on a large scale. This will enable the company to have on hand a sufficient amount of supplies, materials and cash to meet emergencies, make purchases to the best advantage, avail itself of discounts thereby effecting a saving in the cost of operation which will inure to the benefit of the car-rider. This is so generally accepted in modern business practice that no further description should be necessary. As in other instances, the amount and operation of the funds is under constant regulation by the city.

The electric light and power department of Saskatoon, Sask., for the first ten months of the year 1918, showed a profit of \$3,196. The street railway system, however, went in the hole to the extent of \$8,730. The waterworks department, with a profit of \$10,234, enables the public utilities to show a net surplus of approximately \$4,699.

A Diagram From Which May Be Readily Determined the Cost of Coal for Generating Steam

The accompanying diagram furnishes the power plant operator accurate information on the cost of coal for generating steam. Knowing the price and the amount of coal burned and the quantity of water evaporated, the solution is easy. Start with the cost of coal per ton and project vertically, intersecting the oblique line corresponding to the evaporation from and at 212 degrees F. being obtained from the boilers, then move horizontally to the left margin, where the cost of coal to evaporate one thousand pounds of water from and at 212 degrees F. is given. The chart can also be used to determine the evaporation required to generate steam at a certain cost, by reversing the above process. This chart should awaken interest in the relative efficiency of a mechanical stoker as compared with hand firing. The stoker shown in the illustration attacks Mr. Wasted Fuel from the following angles:

1. Smokeless combustion and a high percentage of CO^2 .
2. Volatile substances in the coal are distilled before they are introduced to the incandescent fuel bed.
3. A forced draft system of air control supplies the correct amount of air mixture at all times.
4. Carbon often wasted in the ash is burned before dropping the dumping grates.

Montreal Tramway Extensions .

Mr. Willard F. Graves, consulting engineer to the Montreal Tramways Company, speaking at a luncheon of the Kiwanis Club recently, said that extensions to the Montreal Tramway system would be commenced early next spring, as the company had been notified that the mills would commence rolling the required rails in January. These rails will be of the grooved girder type, weighing 115 pound to the yard. Mr. Graves stated that transportation systems throughout the whole continent were suffering from over-regulation by governments, municipalities and commissions and they were on the point of bankruptcy.

Touching on the capital tied up in the company equipment, he said that twenty per cent. of it was only in use for a few hours a day during the rush hours. There was 1,200 freight and passenger cars in operation, and they travelled 25,000,000 car miles a year through the city. He spoke of the difficulty of getting coal, and of the steps being taken to put in hydro-generators, and incidentally mentioned that the replacing of the cross section at the corner of Guy and St. Catherine cost about \$30,000, while they had come to an arrangement with the city by which it was hoped to make those who excavated under the car tracks and thus damaged the paving for which the company was responsible compensate the company for the damage done.

Municipal Engineers Will Meet in Convention January 30 and 31

The winter convention of the Association of Municipal Electrical Engineers will be held in Toronto, on Thursday and Friday, January 30 and 31. The meetings will be held at the Chemistry and Mining Building, College Street, head of McCaul Street. The programme so far outlined, is a most attractive one, including an address by Mr. W. B. Johnson, of the Montreal Light, Heat and Power Consolidated, on the subject "Advisability of central station companies handling appliances and supplies and maintaining standard prices as established by the manufacturers." Professor W. H. Price, of the University of Toronto, will give an oscillograph talk, and Mr. A. S. L. Barnes will read a paper on "Bare versus weatherproof wires for potentials higher than 750 volts." Mr. W. L. Goodwin has also been secured and will address the delegates on Friday morning on his well known subject of a closer co-ordination of the various elements of the electrical trade with a view to dissolving some of the well known ills. A dinner will be held on Thursday evening, January 30, at a place yet to be arranged, at which the speaker will be Mr. C. H. Hopper, of the Canadian Westinghouse Company. The business will include the election of officers of the association for the coming year. Commercial companies are reminded that, by a resolution passed at the Niagara Falls convention last spring, they are now eligible for membership in this association and we understand a number of companies have taken advantage of this invitation. The executive of the association wish it to be understood, however, that all will be welcome at the convention whether they are members or not.

Taxation and Municipal Railways

Bill No. 64, before the Ontario Legislature, is an amendment to the Assessment Act, and provides for the exemption of municipally owned electric railways from taxation. At a special meeting of the Assessment Committee recently a deputation from St. Thomas protested against the proposed legislation as applied to the London and Port Stanley Railroad, operated by the city of London. It was claimed that this road is not a public utility either in operation or origin, but is solely a commercial enterprise operated for profit. The company's restaurant and amusement business at Port Stanley was also referred to as being a direct competition to those merchants contributing taxes. Mr. T. G. Hellmuth, K. C., on behalf of the London and Port Stanley Railway, claimed that the road was operated at cost and without benefit to the city of London; also that the advantages derived by the townships and the village of Port Stanley more than offset a taxation.

Power for Nitrate Plant

The Union Gas & Electric Company, Cincinnati, Ohio, has recently contracted with the United States to supply power to the nitrate plant at Cincinnati. The company is to furnish electrical energy for the operation of the plant for a demand of not less than 30,000 kw. or more than 40,000 kw., the charge for which is to be computed on a combined demand and energy basis. The power factor guaranteed by the United States is to be not less than 85 per cent. at the power house. The load factor is estimated at 90 per cent. or better, and the estimated consumption of energy for the five year period is 1,750,000,000 kw.-hr.

A recent explosion at one of the buildings of the Canadian Electrical Products Company, Shawinigan Falls, Que., caused damage amounting to about \$100,000. Four persons were killed and ten injured.

A Valuable Catalogue

The Eugene F. Phillips Electrical Works, Limited, are distributing a handsome catalogue descriptive of their wires and cables. This catalogue is divided into five sections. Section 1 deals with electrical conductors; section 2, bare and weatherproof wires and cables, magnet wires, cotton covered wires; section 3, rubber insulated wires and cables, flexible cords; section 4, paper insulated power cables and telephone cables, varnished cambric insulated cables; and section 5, general information. The catalogue is handsomely bound in convenient book form, 4½ by 7 inches, and is a regular encyclopedia of information regarding wires and cables, particularly the final section, which contains tables of weights and measures, conversion factors, temperatures, trigonometric formulae, natural sines, cosines, etc., definitions of electrical units and terms, systems of transmission and distribution, transmission losses, vector diagrams, etc. It is one of the most complete and well arranged catalogues we have seen.

Transferred to Dept. of Trade and Commerce

The Electrical Standards Laboratory, Ottawa, Mr. O. Higman, chief engineer, has sent out notice that the administration of the following Acts of the Federal Parliament have been transferred from the Inland Revenue Department to the Department of Trade and Commerce: The Electrical Units Act; the Electrical Inspection Act; the Electricity and Fluid Exportation Act; and the Gas Inspection Act.

Sherbrooke Gets Temporary Contract

For two days Sherbrooke, P. Q., was without a tramway service, the Sherbrooke Railway Company discontinuing its service owing to the council refusing to meet the request of the company for increased fares. The result of the deadlock was a decision of the council to grant a temporary new contract for five months, under which the fares are 5 tickets for a quarter; 6 workmen's tickets for a quarter within restricted hours, and seven tickets for school children for the same amount. On this basis the service was resumed. A new permanent contract will be drawn up and submitted to the taxpayers. The company and the council have been negotiating for a long time as to extension and fares.

As Great Britain has met with such signal success in its land cultivation programme, so, there are striking indications that a new spirit has been introduced into its industrial life which may go far towards establishing better relations between capital and labor. This new industrial movement is dealt with at length in a pamphlet, "Industrial Relations," already published by the Canadian Reconstruction Association. It furnishes further convincing proof of the progressive temper in which the United Kingdom is dealing with reconstruction problems.

The Winnipeg Electric Railway Company are adding ten new steel cars to their rolling stock. There are being manufactured by the Ottawa Car Company and are at present in the last stages of construction. The Winnipeg company are also re-constructing their present rolling stock at the rate of ten cars per month, forty cars having already passed through their hands.

The Dominion Iron and Steel Company of Sydney, N. S., recently awarded a contract for a 5,000 kw. turbo-generator and two 1,000 kw. motor generators, to the Canadian General Electric Company. The contract also includes a quantity of motor and accessory equipment.

The Dealer and Contractor

Why are Electrical Dealers not D-E-A-L-I-N-G? Why is This Profitable Business Left to the Hardware Man and the Druggist? Does the Goodwin Plan Solve the Problem?

In recent issues we have been pointing out the profitable business that by right belongs to the contractor-dealer, but is being handled by the hardwareman and others. Remembering the keen activity of the British Columbia Association of Electrical Dealers and Contractors, we addressed a letter to the secretary, asking an expression of opinion, and have the following most interesting reply from the president, Mr. E. Brettell. The question in our letter to which he refers, ran as follows:

"It is clear to everybody, we think, that the electrical merchandizing business ought to be handled by electrical contractors and dealers. Where then is the trouble? Is it because the electrical contractors haven't sufficient capital, sufficient enterprise, sufficient ability, sufficient backing by the manufacturers, or what is it?"

Mr. Brettell's Reply

Electrical Supply & Contracting Co. Limited,
Vancouver, B.C., 15th December, 1918.

Editor Electrical News:—

Your letter to Captain Conway, as secretary of our association, interests me very much, so much so that I am going to write you very fully on this subject, though I do so rather as an individual electrical contractor-dealer than as president of our association. Perhaps in my remarks I may appear to have my knife into big companies or corporations, and to start picking holes in them rather than putting our own house in order and endeavoring to help ourselves.

In answering your question—"Where then is the trouble—is it that the contractor-dealers haven't sufficient backing from the manufacturer?"

I am going to refer you to a splendid slogan, if I may use that word, which has been and is now being continuously displayed in "Electrical Merchandizing" and in this slogan that journal is doing much for the contractor-dealer: I refer to the following: "If your overhead is 23 per cent. and you want to make 10 per cent. profit you must add 50 per cent. to your cost of labor and material."

Now, Sir, let me give you two concrete examples and thereby answer "Is it that the dealers haven't sufficient backing from the manufacturers?" Here in our city if a dealer signs a contract with the _____ Company, or the _____ Company, as the case may be, to take \$2,500.00 worth of mazda lamps, he gets a discount of 25 per cent. from the list price; mind you 25 per cent. off an article which is breakable and which one often has to replace to a good customer rather than lose that customer's business in other goods.

Now let it be granted that our overhead varies between

20 per cent. and 25 per cent., (and these figures have been proved): let us also consider the valuable time that is often spent selling a dear old lady perhaps one mazda lamp; next turn to the paper and string that is required, all of which must be taken into account when selling each individual article. Is there a single dealer in Canada who can say he makes money by the sale of tungsten lamps?

Again we are told: "Oh," says the man willing to argue, "Lamps to the electrical dealer are like sugar to the grocer—they bring customers to our stores." In this I fail to agree and even if it were so, there is no reason why a single article should be sold which is nothing more than a dead loss to the business.

Let us take another glaring example: The products of the company are offered by our wholesale houses here at a discount of 30 per cent. off the list. Here again are perishable goods, goods which depreciate if not soon turned over, lamps which are fragile; and on how many occasions do we have to replace batteries that some good customer only uses, or says he does, for a couple of hours.

I have taken the products of three well-known companies and in neither case is the discount sufficient to enable the slogan afore-mentioned to be carried out, and I maintain that in selling these goods the dealer is doing no more than making his overhead, or in other words, he is keeping his store open and running his business as a distributor for the manufacturer, and **absolutely nothing else.**

Another; may I copy Mr. Goodwin and say the "ill of the industry" to my mind is, that it is possible for any consumer, take for instance a lawyer, to purchase his goods elsewhere than in a retail store, and my "elsewhere" means with the electrical wholesaler. In this matter it may be true that the wholesalers, or many of them, sell at the regular retail price, but in other lines of business the wholesaler will not sell **at all**, but will refer his prospective customer to one of the retail stores. In these cases the dealer is losing profit which absolutely and entirely belongs to him. In this matter I therefore maintain that a wholesaler should be a wholesaler only.

After giving this matter much thought I certainly do not place the entire blame on the manufacturer; a great deal must also be attached to the dealer, but I do not believe in the theory that electrical dealers as a whole suffer from lack of capital, lack of enterprise or lack of ability. The electrical dealer, as I know him, compares very favorably with a dealer in any other line of business and, thinking this, I feel there is something wrong in the business, and that something is borne out by two of the examples I have given above.

The time never was more opportune when these matters could be taken up by the manufacturers. The public have become used to higher prices and an opportunity will occur in the period of reconstruction for the manufacturers to deal more generously with the recognized distributor.

In closing let me point out to every electrical contractor-dealer the absolute necessity of becoming a member of his

local association. Let us endeavour, through our associations, not to pass heated resolutions against manufacturers, central stations, etc., but let us rather point out to them that if the dealer is to be the manufacturers's distributor of the future and is to rise to that "place in the sun" amongst business men to which a large majority, by hard work and long hours, are entitled to, reconstruction is necessary, and as long as this is delayed so long will the contractor-dealer hold that supreme seat at the head of the roll which shows that "more electrical dealers go out of business in proportion to the number operating than in any line of business."

This epistle may stamp me as a chronic kicker, but I have stated my opinions freely and I shall follow with the deepest interest any articles which may appear in your columns with reference to this most important matter.

Yours very truly,

(Signed) E. Brettell, President,
British Columbia Association
Electrical Contractors and Dealers.

Having Secured Mail Delivery, Installed His Telephone and Bought His Automobile, the Farmer is Waiting for His Light and Power Plant.

A few short years ago the farmer shook his fist at every motor car that passed his door. They "tore up the roads, frightened the horses, made the highways unsafe for horse drawn traffic and filled the air with unhealthy odors." Today every well-to-do farmer owns his own motor car. With telephone, daily mail delivery, good roads and automobiles, what is it the farmer lacks to make country life contain all the advantages without any of the disadvantages of city life?

Only one thing, apparently—an electric light and power plant. And who is to sell it to him? The machine agent? But he knows nothing about installing and operating it. The contractor eventually comes on the job. Why is he not the logical man to make the sale and also take the profit? There is more profit in selling equipment than in installing it. Why neglect the more profitable work?

Mr. George W. Hill writes a good article in the Electrical Review in which he points out that city central station and power distributing companies have tried extending their lines into the farming districts, but as a rule it has not paid them because of the heavy cost of line construction. The only electrical current practical to use on the farm is from a low voltage, direct current plant on the premises. Those of us who have been connected with the electrical industry for the past thirty odd years, will remember the old direct current generators which perhaps lighted our home town. The other principal electrical feature of the plant is the electric storage battery, the practicability of which has been recognized for more than a quarter of a century. The only essential difference therefore between the plants which have been offered to the farmer and those formerly used for town lighting is the internal-combustion engine which is being used to drive the generator, and the automobile industry has long since solved the problem of the engine.

Nearly all of the farm lighting plants on the market to-day employ engines which resemble so closely the one which the farmer has been using on his farm or on his car, that little attention is paid to this feature of the plant except to know whether it is a two or four-cycle, air or water-cooled engine.

The farmer only has to be sold on the utility of the plant, what it will do for him, how long will it do it, and

how economically as compared with other forms of light and power.

Adaptability and Advantages of Farm Lighting Plants.

The following is a list of the principal things which a good electric light and power plant will do for the country home.

It Betters Living Conditions.—It furnishes better and safer light, eliminates smoky, dirty coal-oil lamps, makes automatic water system possible, minimizes fire hazards, makes the home more cheerful and comfortable, saves much labor around the house, keeps the children at home, and attracts desirable company for the family.

It Pays for Itself.—It makes the following savings possible, thus quickly paying for itself:

Runs washing machine 4 hours each week.....	\$ 1.00
Runs cream separator 14 times each week.....	1.05
Pumps water for a complete supply.....	1.00
Runs vacuum cleaner 7 times each week	1.00
Saves two hours each week in ironing.....	.60
Runs electric fan during hot weather.....	.25
Permits small boy to milk 50 cows 14 times each week, saving 3 grown persons' time 2 hours daily or 42 hours total weekly	12.50

Total (neglecting numerous other chores)\$17.50

Saving \$17.50 each week for 52 weeks results in saving in labor cost of \$910 in one year.

It should not be a difficult matter to sell a farmer something which betters living conditions and also pays for itself in a year or two.

It Modernizes the Country Home.—It provides constant water pressure for the lavatory, the bath, the toilet, and sink, sprinkles the lawn, and furnishes ample fire protection. It replaces antiquated, troublesome and inadequate lighting by modern, convenient and satisfactory lighting. It provides modern conveniences and helps make the country home practically as desirable in this respect as the city residence.

It Provides Convenience and Comfort to Those Who May Be Sick.—It heats water quickly, heats electric hot pad, operates electric fans, provides light at all times of the day or night by merely pushing a button. It does not burn the health-giving oxygen in the room. It provides current for call bells. It assists the doctor in his calls, assists the nurse in her duties and makes the sick room more bright and cheerful.

It Saves the Time and Labor of the Housewife.—It runs the washing machine and wringer, saves much work and many steps on ironing day. It saves the bother and time of taking care of oil lamps. It provides hot and cold water at the sink, sweeps the carpets and rugs with a vacuum cleaner, cleans furniture, mattresses and tapestry without removing. It runs the cream separator for her, pumps the water without effort or time loss, furnishes heat for toasters and coffee percolator, assists the mother in the care of her children at night.

It Saves Time and Labor for the Farmer.—It runs the milking and other dairy machines, farm mill, sheep and horse clippers, grindstone, saw, etc., and provides a bright light throughout yards and out-buildings. It saves much time and lessens the danger in getting about the place at night.

It Makes for More Productive Labor Hours in the Field.—A boy can milk cows, grind feed, pump water and do many other things, electrically which would require the time and labor of older persons.

It Keeps the Children at Home.—Boys and girls enjoy their home better because it is modernized. They invite and everyone enjoys having company. It causes both old and young people to have a pride in their home. Relief

from many of the chores and much of the drudgery gives more leisure to enjoy the home. It provides the best light for students. All told, it makes the home a more desirable place to live in.

It Helps to Solve the Labor Problem.—It makes the farm more attractive to those seeking employment. It eliminates "Blue Monday." Ask mother why. It reduces the amount of work to be done and makes it possible to dispense with all or most of the outside help about the house.

It Is an Improvement to the Farm.—It increases the value per acre like other improvements. It is a valuable, profitable and permanent investment. Electric lighted farms sell more readily.

Opportunities for the Electrical Contractor-Dealer.

Think this over, Mr. Electrical Contractor, and tell us why you cannot sell such plants to the farmers of your community, where you can make him admit all of the above points. Any farmer will tell you that he will buy anything at almost any price which will better living conditions and pay for itself several times over during its useful life.

There are hundreds of thousands of prospects in America, who will sooner or later possess an electric lighting plant of some kind, yet the electrical industry has been asleep at the switch and is letting these great possibilities slip through its fingers.

The result is that the business is fast getting into the hands of the implement dealer, hardware and automobile dealers, and numerous other merchants are looking with eager eyes toward the electric farm lighting business as a means of increasing their annual profits materially.

This business logically belongs to the electrical dealer and contractor. He is the logical person to handle this industry in his respective community, because he is very likely the only person equipped to do the wiring and furnish the fixtures and utility devices. The profit on the sale of a plant, plus the profit on the things which usually go with the plant, is very attractive or at least should be to an electrical contractor and dealer.

Many of our present day contractors would be much better off if they were to spend the same time in the country selling a farmer a plant and installation with practically no competition than he would be playing the role of a Sherlock Holmes in an attempt to learn how much his competitor is going to bid on some house-wiring job where possibly the gross amount of the job would not equal the profit to be had in selling one country electric lighting plant.

The writer could never understand why the electrical contractor could stand idly by and let an opportunity as important as the electric farm lighting business slip through their fingers, while whittling pine sticks on the sunny side of their shops and howling about how rotten conditions are in the particular town in which they live.

Wake up, Mr. Electrical Contractor! Get into the game! Forget the competitor you are trying to put out of business, and put yourself into a good profitable business. You know how to sell goods. You know how to wire houses and barns, and you should be out and after this important, profitable and highly promising business.

Profits in the Business.

You can sell a farmer a lighting plant, do the wiring, hang the fixtures and complete the job, and make \$200 clear on one reasonably sized job in less than a week. How many house-wiring jobs do you do in town to make \$200? How often do you find, after doing a good many jobs, that in an effort to beat your competitor you have lost \$200 or more? If you are in the electric business then the electric farm lighting belongs to you.

You may say that the plant manufacturers are not com-

ing to you to induce you to accept the distribution of their plants. This is true at this time, but if you show signs of life you will find that they would prefer you to non-electrical dealers, because this solves the installation problem—the most perplexing problem they have to contend with at the present time. Now is the opportunity to take back that which slipped away from you when you were "asleep at the switch." The manufacturers are fast learning that the things most needed at this time to complete the cycle from manufacturer to user are intelligent selling and installing. There seems to be a tendency just at this time among these plant manufacturers to change their selling policy materially and this opens a great opportunity for the contractor-dealer to reclaim a branch of the electrical business which came very near being lost to the industry.

How to Do Business With the Farmer.

Secure the agency of some good plant and go to work. The farmer may be a stranger to you at first, but you will soon know him. And he will best know you by your conduct and especially if you deal honorably with him, for he will boost your game if he likes you. He is one of two things, either the best booster or the most persistent knocker in the world.

Sell the plants and make the user help you sell his neighbors. Sell him permanently. Sell him so that he will look to you for all of his electrical requirements. He will go out of his way to tell the world that you are a good fellow and that you treated him all right. He is the nicest fellow in the world to do business with, if you act perfectly natural when you are in his presence. Speak the farmer's language and don't give him the impression that you are the least bit wiser than he is. Just tell him about the merits of your plant, and don't knock the other fellow's plant. Just show him what the plant will do for him and you will find him an interesting listener and a reasonable person to do business with.

The farmer is accustomed to buying high-priced articles like tractors, automobiles, etc., and the writer has often sold a farmer an electric plant and installation amounting to from \$800 to \$1,000 in less time and with less effort than is sometimes required to sell some city customer a \$47.50 vacuum cleaner or a bill of fixtures amounting to less than \$100.

Merchandising to the farmer consists of having a meritorious article and the ability to tell him in a plain elementary way what it will do for him. It was first thought that the farmer would buy only cheap electric fixtures and the larger plant concerns arranged catalogs and displays based upon this idea, but they have found that the farmer demanded something better, and to-day the farmers are buying the highest class fixtures on the market.

The writer recently sold a farm electric light plant for \$650 and he also sold the wiring, fixtures, a vacuum cleaner, iron and an electric washing machine, and when the job was finished the farmer handed him a check for \$1,045 cheerfully, for there was not a better set of fixtures in ten homes in an adjacent town of 25,000 people. This job was completed in exactly five days. Four such jobs per month would net the dealer approximately \$1,000 monthly, or \$12,000 per year. This is possibly as much profit as would be had on three or four times the gross business done in town where unintelligent competition must be met.

The selling of an electric lighting plant to a farmer, if sold properly, places him in the market for an amount of wiring, fixtures, and accessories equal to, if not exceeding, the price of the plant. He may not buy them all at once, but from time to time you will be called upon to furnish one or more utility devices. The good, conscientious dealer who sells 25 plants in his neighborhood has made a nice

profit on the sale and has created a demand for some ten to twelve thousand dollars worth of lamps and other accessories within the next 12 or 18 months.

How do you Figure Selling Prices and Profits? How Many Times Turn Your Stock in the Year?

It is often said that electrical contractors are poor merchandisers—they are weak on bookkeeping and organization; forget about their overhead charges and otherwise conduct their businesses as good business men ought not to do. A good helpful article by W. R. Thompson, of the Industrial Service and Equipment Company, of Boston, on figuring costs, in a recent issue of *Contact*, runs as follows:

How Shall We Figure Selling Costs?

"Shall profits be figured on the cost or the selling price?" has in the past few years been a much mooted question. It is coming to be common practice, however, to figure profits on the selling price, merely because the other figuring operations involved are simpler. Otherwise, it doesn't make a particle of difference which method is used, so long as all percentages are figured in the same way. There are, however, several important considerations in figuring profits which are often overlooked and which it is the purpose of this article to discuss.

A percentage of profit, like every other percentage, arises from the ratio of certain figures. For instance, at the end of the year when a merchant has calculated his year's profit, he has only to divide this profit by his volume of business to determine the part of every dollar that is left as profit. In like manner, if he divides the total cost of doing business by the volume of sales, he has the part of every dollar that went into expenses. Again, if he divides the total cost of goods sold by the volume of sales, he has the amount of every dollar that represents merchandise sold.

Suppose for illustration that your sales for the past year amounted to \$50,000; that the cost of the goods shown by a carefully taken inventory and a depreciation charge, was \$30,000; and that the total cost of doing business was \$15,000. This would leave a net profit of \$5,000, which would be ten per cent. of the total sales. Cost of goods would be sixty per cent., and cost of doing business thirty per cent. of the sales. This means that to maintain the same profit and sustain the same cost of doing business the mark-up for the coming year must, on the average, not fall below forty per cent. of the selling price. Notice that I say "on the average," which does not in any sense mean that each individual invoice should be marked up at that rate.

The purpose of establishing an average mark-up percentage is simply to check up on all purchases as a whole. This seems to be a point of view that is hard for many retailers to understand. Average mark-up, based on the past year, simply determines the average gross profit you may expect in your particular line.

Turnover a Vital Factor.

The amount that any individual invoice should be marked up should be determined on the basis of turnover. For instance a line of goods which will turn four times a year can profitably be marked with one-fourth the mark-up of a line that turns only once.

As a matter of fact the factors that determine the price are generally market conditions and customers' desires. But any individual mark-up should at least equal that average gross profit multiplied by the average turnover in your store; this result, in turn, divided by the estimated turnover for the line being marked. To continue with figures used above, your

average mark-up has been established at 40 per cent. Your average rate of turnover is, we will say, two and one-half times a year. Multiplying forty by two and one-half you obtain 100. Now suppose you are marking an article that past experience shows you should turn over four times in one year. Dividing 100 by four you obtain 25, which is the percentage of mark-up that the article in question should bear. Still figuring your percentages on sales, and supposing that the article in question costs 75 cents, you should be able to sell it for at least one dollar. If it will not sell at that figure, it should not be stocked unless for some reason it is desired for advertising purposes; that is, as a leader or because it is an article that people demand in stores like yours.

Variations of the Mark-Up

One of the records of the greatest value to the management is that of purchases showing the variations of the mark-up. It is by watching this variation rather than by watching sales, that the gross profit can be controlled. Do not misunderstand me. I do not say that sales should not be watched, for they should be—both by clerks and by departments. Increased sales is a thing to promote. The point I want to make clear to every merchant who doesn't already see it, is that unless the goods that you are pushing to increase sales show proper mark-up each month, the expected profits will never show up in the form of actual earnings.

Personally I am of the opinion that there is more benefit to be derived by having a proper record of purchases, showing the expected gross profit, so that each month the merchant can see how near his purchases show his average mark-up necessary, than by any other method. Once a thing is bought it has to be sold, so the place to put on the brake is before the order is made.

If every retailer would get into the habit of figuring the mark-up and turnover of a line before he buys, and comparing it with his average needed to cover his cost of doing business and his desired profit, he would have less goods upon which he must force a sale by special prices.

Study Mark-Downs.

Of course, it is a well recognized fact that certain articles will have to be marked-down in order to get rid of them. All such mark-downs, however, result in a reduction of the average mark-up or gross profit estimated. Unless the management takes this fact into consideration in figuring the expected profit for the year, it will, of course, fall short by the amount of the reductions.

Many retail stores are paying for their own reductions by taking them out of net profits, instead of counting mark-downs as a regular cost of doing business and including it in the original mark-up average which must be maintained.

Every retailer should keep a record of all reductions and make provision for this expense as he does for all other costs. Such a record is easy to keep. One may have a special note pad on the counter on which every reduction is noted or the amount of the reduction as well as the amount received or charged may be recorded on the sales slip.

Each day's reductions should be totaled and posted to the mark-down record. At the end of the year, or six months, or whenever you have an accounting, the total of all reductions should be found. These should be divided by the total sales during the same period of time. The result will be your percentage of mark downs and this percentage should be added into the estimated gross profit in figuring mark up. For example, suppose that you have found your other expenses are 28 per cent. of your sales, you want to make 10 per cent. net profit, and your mark-downs total 2 per cent. of your sales. By adding these you have 40 per cent. which must be your average mark-up.

Keeping the Store Force on Its Toes — How Advantages of an Adequate System of Daily Records Speed Up Turnovers

By Mr. Perry F. Nichols*

"Well, I won't take one to-day, but maybe I'll be in again," said Mrs. Palmer as she turned and left the store.

Now every clerk knows what such a statement generally means. It means that the customer will keep on looking around and probably buy elsewhere, if she buys at all. In most stores her statement would have been the end of the matter. The clerk would probably have regretted losing a possible sale. But that would have been all.

But it was otherwise in the store of The Edwards & Chamberlin Company, of Kalamazoo, Michigan. Charles Stewart, a clerk, who had been showing Mrs. Palmer electric vacuum cleaners, went over to a small desk on the counter and made out a "prospect slip" from remarks she had made. While he had been waiting on her, Stewart had found out that the woman's name was Mrs. Sidney Palmer, that her husband was a machinist earning good wages, that they had just come to Kalamazoo, that her address was 1426 Prospect avenue, as well as a number of other bits of information show-

come up to the cashier's office they are placed on spindles with corresponding numbers. Each morning these slips are added and posted on a daily sales record. The charge sales, which are kept separate from the cash sales, are also added, and each clerk is credited with the charge sales which he has made. The cash and charge sales are then added together thus giving the day's total for each clerk.

At the end of each week these daily sales are transferred to a weekly report and totaled. The number of sales made by each clerk is also recorded on this weekly sheet. One of these weekly records is shown here.

The first general column is headed "position" and under that are the sub-headings "amount," and "number." Under these two sub-headings are placed the rankings of the various clerks. That is, the clerk whose sales total the largest amount of money has a figure one placed opposite his name in the amount column, the second in rank a figure two, and so on. The same plan is followed in respect to the number of sales made by each clerk, as the clerk who has the largest money total does not necessarily make the greatest number of sales. The remainder of the blank is self-explanatory.

Each clerk receives a card every week showing his position with reference to the number of his sales and also

Record of No. and Amount of Sales for Week Ending _____ 191

ing in what kind of goods she and her husband would likely be interested. This information was copied on the prospect slip which was then sent to the advertising department.

Arrived at the advertising department H. C. Teller, advertising manager, placed Mrs. Palmer's name on a mailing list of those interested in vacuum cleaners. Several pieces of advertising, including a personal letter, were sent to her, all setting forth the advantages of the particular cleaner in which she was most interested. The result was that about 10 days later she came in and bought the cleaner. And that was not all. She became a regular customer of the store, buying many household supplies there.

The foregoing incident is only one of many similar incidents that occur every day in this store. The clerks are up on their toes every minute trying to turn each shopper into a customer—if not at once at least eventually.

How the Sale Was Clinched.

The management has worked out an exceptionally effective plan for keeping the clerks interested in preventing any sales from getting away. It begins with the daily sales slips and ends with a 1 per cent. commission on each clerk's sales, the commission being paid every six months.

The clerks are numbered, and as the cash sales slips

their amount. This keeps up the interest and there is always a friendly rivalry to see who shall occupy the first places.

The large record sheet mentioned earlier goes to A. B. Teale, manager of the retail department. This gives him a check-up on what each of the clerks is doing and enables him to give a word of praise to those whose records are satisfactory and help up to scratch those whose marks are not so good.

Records That Helped.

Here's an example. Not long ago, the sales of one of the clerks keep steadily dropping off. The management figured out that during a six month's period his salary had amounted to 12 per cent. of his sales. That was obviously too much. So he was called into the office and Mr. Teale had a heart-to-heart talk with him, explaining that no electrical merchant can afford to pay a clerk more than 10 per cent. of his sales, and that the percentage really should be lower than that figure. The result of this little talk was a decided increase in this clerk's sales, and a dropping off in the ratio of his salary to sales.

To help the clerks make good records, there is a short fifteen minute meeting every morning, when problems of selling and other matters of store interest are taken up and talked over. Then there are the prospect slips, already men-

* Burroughs Adding Machine Co., Detroit, in Contact.

tioned, and suggestion and recommendation slips, all intended to help make it easier to sell goods. The suggestion slips are green sheets of paper on which clerks are encouraged to write suggestions and recommendations for improvement in the service. The ideas suggested include everything from the fact that the back door needs a new lock to the recommendation of a plan for improving the delivery service. A record is kept of the prospect cards and suggestions made, as every clerk is supposed to hand in at least one of each weekly.

A Novel Efficiency Plan.

Another novel plan for keeping the sales force at top notch efficiency is the bulletin book. This is a book located on a stand in a central position on the first floor. Here bulletins from the management are posted from time to time. These bulletins cover all manner of store matters. Each employee is supposed to look over the bulletin book at least every 24 hours, and read the new bulletins. There is a series of numbers of from 1 to 100 at the top of the sheet; after an employee reads an announcement he is supposed to check his number, showing that he has seen the notice. This is a simple method of being certain that the employees are informed of all of the things they should know.

But however helpful the friendly rivalry and bulletins may be in sustaining a keen interest in 100 per cent. salesmanship, the firm of Edwards & Chamberlain recognizes that it demands a more direct appeal to the clerks' self-interest to keep undimmed their desire to become first-class salespeople. As a clincher, therefore, to keep them sold on the proposition, each clerk in addition to his regular salary is given a commission of 1 per cent. of his, or her total sales. The commission is computed twice each year.

The new plan of payment went into effect January 1, 1918. It is too early, therefore, to vouch for its effectiveness. But this much is certain: The sales for 1918 are showing a steady gain over those for 1917, and the clerks' appetite for speeding up sales shows no sign of satiation.

How Much Is Your Overhead?—An Association Formed to Study this Problem

The Electrical Estimators' Association is a live organization in Chicago. Recently they met with the Chicago Association of Electrical Contractors and Dealers to discuss and decide as far as possible the extent of the overhead expenditure of the electrical contractor. The meeting is reported in the Electrical Review.

It is well known that this overhead charge is probably the least understood and most unruly item entering into the finished estimate. As a result, overhead has probably stolen more profits and killed more enterprises than any other item entering into business cost. The Estimators' Association recognized some time ago, that before the contracting business could be placed on a secure and stable basis, this problem must be solved. Accordingly a committee was formed which, after an exhaustive study of the situation, presented at this meeting one of the best solutions so far devised.

It was decided early in their investigations that percentages of the annual business or any other method which involved the average percentage of a number of jobs of different sizes would not suffice. This was the result of the well-known fact that the percentage of overhead is much higher on a small job than it is on a large one. For this reason, any average percentage for jobs involving different amounts would overtax the overhead on a large job to make up for the loss created by underestimating it on a small one. This condition would be but little better than the existing condition.

The obvious remedy, therefore, is to change the percentage of overhead charged to jobs of different sizes. In ac-

cordance with this scheme the committee arranged a tentative curve which gave the approximate percentages to be charged to different jobs according to their size. A description of this curve and the conditions which led to its adoption were presented by E. L. Morley, and the L. K. Comstock Co. This curve, which starts with 52 per cent. for a job costing \$200 and reaches a practically horizontal line at 8.5 per cent. for jobs of \$160,000, will be reported with the full text of Mr. Morley's address in an early issue.

In opening the discussion Mr. W. C. Goodwin suggested that this curve be immediately adopted by contractors, but, to perfect the plan, recommended that on account of the varying amount of supervision necessary, for example in wiring a factory as compared with a church having the same cost, auxiliary curves covering the different classes of installation should be drawn up.

In the active discussion which followed, many interesting points were brought out which proved the growing necessity of such a curve to the contracting business. That something must be done to stabilize prices, which were often so widely distributed as to cause owners to decide to do their own work, was the general idea expressed by many of those present.

Mr. Goodwin called attention to the laxity of contractors in continuing their relations with customers whose premises they wire. The contractor should not be satisfied with merely installing the original wiring, but should endeavor to continue and extend his operations. As the first electrical man on the job the contractor has a distinct advantage over the jobber or manufacturer in selling the customer his apparatus and appliances. In addition, a sincere effort should be made to contract for the maintenance of the plant. When this condition is reached, that is, when contractors have stores at which they sell appliances, etc., and the maintenance of electrical equipment is done by contractors on a contract basis, then only will the contractor occupy the position in the electrical field to which he is entitled.

Toronto Contractors and Dealers

A meeting of the Toronto Branch of the National Electrical Contractors and Dealers Association was held on December 12, at the King Edward Hotel. Applications for associate membership were received from two of the most important electrical concerns in the country—the Canadian General Electric Company, and the Northern Electric Company, the former company being represented by Mr. J. F. Edgar, and the latter by Mr. Davis, their district manager.

One important question brought up was the practice of some contractors requesting from their suppliers falsified invoices, and association went on record very definitely against such dishonest practice.

There was also some discussion on the cost plus percentage system of taking work and Mr. Geo. Dale was appointed as a committee of one to correspond with other associations to secure information regarding their standard practice in regard to work taken on this basis.

The report of the Labor Committee was read and it was asserted that negotiations with the union were proceeding in a very friendly way. Further announcement will be made later as to what agreements are reached.

A preliminary report of the treasurer was presented in regard to the expenses of the Goodwin campaign. The report of the Joint Examining Board was also read and there was considerable discussion on all the points.

The attendance at the meeting was fair but not up to the average, and it was unanimously decided to go back to the former customary dinner previous to the meetings. The date of the next meeting will be January 9, the second Thurs-

day of the month. The place will be announced later to all the members.

It is important that all the members of the old association should have their formal written applications for membership in the National Association in the hands of President McIntyre before the first of the year. It has been announced that all the members of the British Columbia branch of the association have already sent in all their applications for membership.

Fine Store of Main Electric, Montreal

The store of the Main Electric Company, 165 Craig Street West, Montreal, is one of the largest in the city, being 150 x 140 feet. The store is in the form of an L with the office at the end. The L portion is devoted to lighting fixtures, which are hung from the ceiling and placed on tables, with a special

Interior Main Electric Company's store, Montreal

shelf for glass globes. Except for the space reserved for the office, the other portion of the store is set aside for the retail sale of supplies. These are mainly kept in a long row of fixtures placed behind the counter, and so arranged that the heavier supplies are kept on the bottom rows. The bins for lamps are placed at the same height as the counter, and occupy one entire row of the fixtures. In addition to the store, there is a large warehouse at the side. The company, of which Mr. J. Rosenthal is manager, does a wholesale as well as retail trade. A very large stock of supplies and fixtures for "factory and home" is maintained.

Mr. Contractor Dealer—Electrical Goods "Sell Themselves" But the Hardware Men Get the Profits

An unusual impetus to the sale of electrical labor saving apparatus for women is promised by Miss Christobel Pankhurst, the noted suffragette, in her election platform. She promised the voters that when the women's regime prevails in parliament every house, no matter how small, will be lighted, heated and served by electricity.

The British Parliament, she asserted, will be responsible for the electricity that turns the mangles, cooks the meals and warms the houses. Why, she asked, should women drag coal scuttles about and stand over steaming wash-tubs, spend hours over old-fashioned ranges, which not only eat up coal, but cook the cooks, when by legislation and electricity the burden of the world can be lifted.

That is merely the forerunner of a development that promises immense business for hardwaremen, not only in England, but all over the world. In Canada it is predicted

by many that the uses of electricity in the homes will double and treble in the next ten years. Already hardware men are selling a big share of the electrical devices and they are doing a steadily increasing business. Both the electrical manufacturers and the hardwaremen are going after this business aggressively and as the goods largely sell themselves, because their usefulness needs little or no demonstration, the business is growing by leaps and bounds.—From a Canadian Hardware Journal.

I Am Your Worst Enemy

I am the ruler of retail reverses.

I am the Lord High Potentate of Failure.

I am the reason for that downward slant on your profit curve.

I am the cause of the silent sickness that stills your cash register bell.

I am the origin of dissatisfied customers and loss of trade.

I am the leaven of uncertainty in the midst of certain profits.

I am the element of chance that turns a winning business into a losing gamble.

I am the fountain-head where springs the majority of your troubles and worry.

I am the key to the problem why more than 15,000 retailers fail every year.

I am the why and the wherefore, the direct and proximate cause, the germ and the genesis of unsuccessful merchandizing.

I am the Sticker, the Shelf-Lounger, the Left-Over, the nameless child of an unknown father.

I am the unadvertised product!

Retail Public Ledger.

New Square D Safety Switch

The accompanying illustrations show the new safety service entrance switch recently introduced by the Square D Company, of Walkerville, Ontario. The switch is catalogued as No. 56211. The chief features of the switch, aside from safety, are compactness and low price. A special porcelain plate has been developed to aid in cutting down unnecessary size, and giving more room for making connections. The extra room and shallow sides make this type of safety switch very popular among the trade. The switch is constructed of sheet steel, with a latch which may be locked, so that un-

authorized persons cannot open the door. Four one-half inch knockouts are provided in the top and bottom of the box, thus making it adaptable to any style of wiring.

The Essex Terminal Railway, a belt-line running through the factory districts of Windsor, Sandwich, Walkerville and Ford, is to be extended to include Amherstburg, 18 miles west of Windsor.

Battery Charging—The Main Electric Manufacturing Company have issued a bulletin describing their battery charging equipment for public garages. This is a small capacity equipment for isolated garages.

BALL GLOBES FOR EXTERIOR LIGHTING

Current News and Notes

Alvinston, Ont.

A by-law has been passed by the town of Alvinston, Ont., authorizing payment of \$2,807 for the purchase of the plant of the Alvinston Power Company.

Brantford, Ont.

A by-law will be submitted on January 1 to the ratepayers of Brantford, Ont., authorizing an expenditure of \$125,000 for extension of the street railway to Terrace Hill.

London, Ont.

The latest compiled census of the population in London, Ont., estimates the number at 67,243 and there is consequently a need for street railway extensions. The company claim, however, that, as they have been refused fare increases, they are unable to finance any improvements. It is proposed, therefore, that the new 1919 City Council take up the matter of "service-at-cost" with a view to overcoming the difficulty.

Lucknow, Ont.

A by-law will be submitted to the ratepayers of Lucknow, Ont., authorizing an expenditure of \$5,000 for the purchase of the electric lighting plant of Walter Stewart & Son.

Montreal, Que.

It is said that negotiations are advancing with respect to a possible amalgamation of the power plants of the Montreal Tramways and Power Company with the Montreal Light, Heat and Power Consolidated, and that sufficient data is on hand to enable the directors to bring the matter to a definite head. The combined capital of these two organizations is in the neighborhood of \$100,000,000.

Niagara Falls, Ont.

A by-law will be submitted to the ratepayers of Niagara Falls, Ont., on the question of purchasing the Niagara Falls Street Railway and operating it as a municipal enterprise. The road is at present being run at a loss, but the city fathers believe that in their hands it would become a very paying utility. In the event of the by-law being passed the company will be given a year's notice dating from March, 1919.

Orillia, Ont.

The Water, Light and Power Commission of Orillia, Ont., report for the year ended December 10, total power house receipts of \$112,005, of which \$76,553 was for power and the balance for light. The operation and maintenance of the plant cost \$31,606, which is nearly \$15,000 more than the cost before the war. In addition to this, \$18,400 was paid for debenture interest, \$13,133 was paid off debentures, \$1,800 was contributed to patriotic funds, \$2,222 expended in substation reconstruction, \$10,000 set aside for depreciation, and \$5,000 was set aside for the insurance contingency fund. The total amount expended in connection with the Swift Rapids plant was \$179,390. The debentures provided for \$110,000; the Dominion Government paid \$25,000, and \$10,000 is to come from the Hydro-electric Commission.

Toronto, Ont.

A by-law has been passed by the Toronto City Council authorizing the expenditure of \$650,000 for extensions to the hydro-electric line and other purposes.

The Toronto Street Railway Company now operate over the new Bloor Street Viaduct, connecting Bloor Street with Danforth Avenue. The Bloor Street cars, which commence the eastward trip at Bloor and Lansdowne, have been re-

routed to travel directly cross-town over the viaduct, instead of turning down-town as they did formerly. The cost of the viaduct was in the neighborhood of \$2,500,000 and about 15 minutes is saved on the cross-town trip.

The Hydro-electric Power Commission of Ontario is asking the Dominion Government for a refund of an amount between ten and fifteen million dollars expended on plant, machinery and duty in connection with the new Nigara pipe line. It is claimed the pipe line will be unnecessary on account of the Chippewa development and that it was carried through purely for war purposes.

The eighteenth annual general meeting of the Toronto Electric Light Company's Employees Mutual Benefit Society, recently held, showed total receipts for the year amounting to \$1,480.85. After meeting all liabilities there was \$218 left on hand. Officers elected are: Hon. President, R. J. Fleming; Hon. Vice-President, D. H. McDougall; President, W. Rodgers; Vice-President, C. Richards; Secretary-Treasurer, E. Felton.

Uxbridge, Ont.

A by-law will be submitted on January 6th in Uxbridge, Ont., authorizing an expenditure of \$7,000 for the purchase and improvement of the local electric lighting plant.

Personals

Mr. G. I. Davidson has been appointed advertising manager for the Canadian General Electric Company. He has been with the company for eighteen years.

Mr. John Mitchell, inspector of C. P. R. telegraphs, eastern division, has been promoted to be superintendent of traffic, eastern lines, in succession to Mr. W. M. Thompson, transferred to the superintendency of the eastern division.

Mr. H. D. Townsend has been appointed electrical superintendent of the Dominion Iron and Steel Company's works at Sydney, N. S., succeeding Mr. Collins, who has gone to the United States. Previous to going to Sydney Mr. Townsend was chief electrical superintendent for the United States Steel Company, Loraine, Ohio.

Mr. M. C. Gilman, formerly sales manager of the Toronto Electric Light Company, and for the last few months manager of Willis L. Adams' Montreal office, has joined the staff of the Montreal Light, Heat and Power Consolidated, as special agent and research engineer. Mr. Gilman for a time acted as secretary of the Canadian Electrical Association.

Mr. Charles F. Gray, M.I.E.E., M.A.I.E.E., consulting electrical engineer, Winnipeg, has been elected mayor of Winnipeg, by a majority of almost 5,000. At the former civic elections Mr. Gray was re-elected to the position of Controller, in charge of Street Commissioner's Department, Fire Department, Civic Offices, Assessment Department, Building Inspection, Library and Public Baths. He was also placed on the Police Commission.

Mr. Arthur Moss, chief engineer of the Hydraulic Service of Quebec and member of the Quebec Streams Commission, has been added to the Dominion Power Board as a representative of the water power interests of the Province of Quebec. It is stated that arrangements are being perfected for a conference early in February of all Dominion and provincial organizations which have to do with the investigation or utilization of power resources.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

WANTED

ELECTRICAL ROAD-SALESMAN to travel London District for large Electric Manufacturing and Jobbing Company. State salary and experience. Would prefer married man. Address, W. R. O., 141 Roxboro St. East, Toronto. 1

Experimenters have found that the usually difficult problem of providing an even temperature for bread raising can be solved with Mazda lamps, says the Mazda Stimulator. A 40 watt Mazda, or larger if the sponge is large, burning in

a cardboard box placed over the covered bread pan, provides an even temperature and helps to relieve some of the housewife's difficulties in bread making.

Conduit Should not be Fished Until Plastering is Completed

Conduit should not be fished until the plastering is completed, because prior to the putting on of the plaster there is always a possibility of the conduits being interfered with. If they are fished before the plaster is on and are accidentally displaced, the fish wire may be bound in the conduit in such a way that it cannot be withdrawn. For these reasons some engineers and architects insist that the above specifications in regard to fishing be followed.

Motor Wire Straightener

In the establishment of the Campbell Industrial Company, Chicago, a motor wire straightener is in successful operation. To adapt a motor for this service a hole is drilled through the motor shaft, unless the shaft is already hollow. Then a tube is bent so that it has a couple of "waves" in it. If no tube of suitable diameter and proportions is available, a rod, through which an axially-located hole has been drilled, can be used instead. Then this bent tube is fitted into the end of the motor spindle and held

securely therein. The motor should operate at from 1,800 to 2,000 r.p.m. The wire to be straightened is first threaded from the spool, upon which it was shipped, through the hole in the motor shaft and then through the bent tube. Then the motor is started and as it rotates the wire is pulled through and will be straightened by the process. —Electrical Merchandising.

- Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.
- Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

ELECTRICAL NEWS,

347 Adelaide St. W., Toronto, Ontario

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

The Right Start for A Prosperous Year

*There is Opportunity
Ahead!*

Again, this New Year, every **Electrical Dealer** will be seeking broader—bigger—markets. Opportunity—big, broad and lasting—is waiting for you in

Cora

*The Glassware for
Efficient Lighting*

Wherever good light is needed—wherever **Quality,—Efficiency,—Beauty** are the considerations—there you will find a ready market for “Cora.”

Why not be the “Cora” dealer in your town?

Let 1919 bring you larger profits—increased prestige—still more permanent trade.

Send for the “Cora” Catalogue
and let it work for you.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating informa-
tion no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamil-
ton, Ont.; London, Ont.; Montreal, Que.;
Ottawa, Ont.; Quebec, Que.; St. John, N.B.;
Toronto, Ont.; Vancouver, B.C.; Victoria,
B.C.; Winnipeg, Man.; Calgary, Alta.; Ed-
monton, Alta.

"PITTSBURGH"

The Scientific Show Window Reflector

Illustration shows "Pittsburgh" Reflector No. 100, for 100 or 150 Watt Lamp. Dimensions: Height 8 inches, width 8 5/8 inches, holder 2 1/4 in. Form "0."

It redirects and controls the light to give the greatest possible illumination to the object. The "Pittsburgh" Reflectors, by scientific construction and test give the maximum result from your lighting, and will pay for their small cost in saving of current. Don't fail to write for our folder on lighting efficiency.

Westinghouse

Synchronous Condensers for Power Factor Correction

2750 Kv.a. 6600 Volt, 3-Phase 60 cycle, 600 RPM Westinghouse Synchronous Condenser

Feeder losses depend on current, not on true energy transmitted. Lower power factor increases losses and decreases capacity.

Westinghouse Synchronous Condensers

improve power factor, thereby reducing losses and increasing existing feeder line outputs. They are money savers for many users.

Our nearest office will supply you with data for any size, and for any special service. We build them self-starting, or where very low starting Kv.a. is essential, with a special induction motor that automatically brings them up to synchronous speed, or with oil-pressure system, as preferred.

**This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission**

**They use it for
STREET LIGHTING**

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

*We extend a cordial invitation to the electrical fraternity
 to call upon us in our new building—the largest and best equipped
 electrical repair establishment in Canada.*

Reduce Distribution Troubles and Expense

in these Five ways—

- Equip to handle “trouble” without costly cable or line cutting.
- Eliminate expensive “temporary” repairs.
- Install cable-end sealing devices.
- Stop extended service delays.
- Make every circuit interconnecting without cable or line cutting.

IT is the purpose of G & W distribution specialties to obtain maximum distribution economy for a minimum of cost—it is the purpose of G & W Engineering Service, with 15 years' experience for a working back-ground, to see that you do get just that.

Nowadays preventable waste is almost the same as deliberate destruction. G & W distribution specialties plus G & W application service can help you eliminate many costly, untimely distribution troubles. Ask us for the solution of your most troublesome distribution problems!

Have you received new Catalog No. 10? Contains Valuable illustrations and drawings for every Central Station Engineer

Quality of Materials

Prompt Deliveries

Fair Prices

THESE are the big factors that appeal to every Electrical Contractor who deals direct with the Northern Electric Co. Some idea of the reputable lines we carry may be had from the partial listing which follows:

Duncan, Benjamin and Bryant Sockets

R. Thomas & Sons — Knobs, Tubes and Cleats.

Thomas & Betts Outlet Boxes, Floor Boxes, etc.

Grouse-Hinds "Condulets" and Panel Boards.

Northern Electric Sheet Steel Switch and Cutout Boxes.

"Adanac" and "Imperial Higrade" Rubber Covered Wires.

Wiremold Metal Molding and Fittings.

"Duraduct"

"Detroit" Distributing Cabinets.

The geographical location of our nine branch houses, each with their complete stocks of everything in the electrical line, ensures prompt service.

Our nearest house will gladly furnish catalogues and prices on application.

Over Nine Million

BussFuses

ELECTRICITY'S SAFETY VALVE

Poured Into the Electrical
Users' World During 1918.

In less than four years, the sale of BUSS Fuses has increased
from 291,767 to 9,000,000.

3600% Increase in Four Years

is conclusive evidence of the superiority of mechanical design
and supremacy of quality of BUSS Fuses. Note these figures:

1915	Buss Fuses Sold	-	-	291,767
1916	-	-	-	1,325,538
1917	-	-	-	4,650,297
1918	-	-	-	over 9,000,000

What will 1919 bring?

We have set our mark to over 18,000,000. Our increasing
facilities and scientific production will be equal to the task.
Strict confinement to our high standard of quality will assure
the attainment of our goal.

*BUSS Fuses are furnished in all types
of renewable and non-renewable.*

A Comparison

Sherardizing Steel & Creosoting Wood

The Purchasing Agent for one of the largest Hydro-Electric Power Companies, upon having the Sherardizing Process thoroughly explained to him, remarked:

"Then Sherardizing, as a method of protecting steel, is like creosoting for protecting wood."

He has since insisted upon the delivery of **SHERARDUCT** on all conduit orders.

The two processes are markedly similar, both in treatment and results attained. **SHERARDUCT** is the only Sherardized Rigid Steel Conduit. Both interior and exterior surfaces are Sherardized and further protected by coatings of a clear acid- and alkali-proof enamel, baked on. Has the combined advantages of zinc and enamel protection. Double value for one price. We can't tell you all about it here; write for complete information.

WHEELER REFLECTORS

NES

Characteristic Angle
Light Distribution

WER

Characteristic Light
Distribution

PES

Characteristic Intensive
Light Distribution

Designed and manufactured by Specialists in Industrial Illumination with long experience in the production of Reflectors to meet every condition of operation.

Performance

Reflectors must be selected for the work conducted by their light. The Characteristic Light Curves indicate the performance. General Illumination with Group "W" (Wide) Reflectors is best adapted to large rooms and bays. Localized Lighting with Group "P" Reflectors for confined spaces, individual machines, work benches, etc., and Group "N" (Angle) Reflectors mounted on the side walls, serve areas inaccessible from above because of moving cranes or high standing apparatus.

and

Construction

Wheeler Reflectors are fitted with holders for brass or porcelain sockets, with collars to fit standard holders, with detachable canopies or canopies enameled in one piece with the reflector. Sockets are secured to nozzles with hexagonal shoulders fitting hexagonal holes in canopies to prevent turning. The general construction is substantial and readily accessible for wiring.

The Meter of Merit

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance—
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

LITTLE WORDS WITH BIG MEANING

According to "Webster,"
Quality is "an excellence
of character; natural
superiority."

Webster's definition of
"Service" is: "The per-
formance of labor for the
benefit of another."

We use these words advisedly—fully understanding their definitions—and realizing the obligation we place upon ourselves by their continued use in connection with our products of Iron and Steel, and our attitude to the people we serve.

Slip tip under hooks

turn over and down on the wire

clinch the lips and the job is done.

O-B TROLLEY FROGS PREVENT TRAFFIC DELAYS

Simplicity causes O-B Trolley Frogs to go up on the line with minimum delay to traffic. Their strength and endurance keep them there.

Trolley wires are anchored by a single powerful clamp secured in the Type E by two bolts, in the smaller Type D by one.

O-B Bronze Cam Tips form the approaches. The pictures show how easily they slip into place. These Tips make a smooth path for the wheel from wire to pan. It is easy to renew them.

THE OHIO BRASS COMPANY, Mansfield, Ohio

O-B Type D Frog, suitable for moderate speeds and all general city service.

O-B Type E Frog, adapted for high speed service and for use where several types of cars are operated over the same line.

Send for "Saving Time on the Line." It describes the complete line of O-B Cam Tip Devices. : : : :

ARC WELDING—RAIL BONDING

ERICO PORTABLE RHEOSTAT constitutes a complete arc welding set which can be used in shop or along track, wherever the power line runs, for general arc welding purposes such as joining frame members, building up worn axles, mending leaky pipe lines, and repairing worn key ways in armature shafts as well as broken parts.

Furthermore, when used with the ERICO PORTABLE WELDER the most efficient and durable rail bond on the market can be installed with an ease and speed that are unrivaled. The rheostat weighs 140 lbs., the welder 65 lbs. No trouble in clearing traffic.

The curtain is just descending, marking the end of the last act of the great drama of war.

Canada flew to arms at the first call of war and from Ypres to Mons the Canadian Corps never gave up a position they were ordered to hold or failed to take a position they were ordered to capture.

The high courage, resource and fortitude with which Canada met, endured, and with our allies, triumphed in war, is ample assurance that :

Canada with all her wealth of natural resources, man-power and industrial equipment will "**carry on**" in these reconstruction days, will not merely bring our affairs back to normal but expand to meet the necessities of a world hungry, unclothed and unhoused.

Co-ordinating with its brothers in industry, the Benjamin Company is bending every effort to reach that point where it can take its proper place in the work of the wonderful years that lie before us.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renout Publishing Company. 248 pages, illustrated. Price \$2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.

Electrical Machinery—Principles, Operation and Management, by Terrell Croft. Just published by the McGraw-Hill Book Co. 318 pages, illustrated. Price \$2.00.

Electrical Meters, by Cyril M. Jansky, B.S., B.A. Second Edition, just published by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

How to Sell Electrical Labor-saving Appliances." Recently published by McGraw-Hill Book Co. 115 pages, illustrated. Price \$1.00.

"Practical Electricity," by Terrell Croft. First edition. Just published by McGraw-Hill Book Co. 646 pages, illustrated. Price \$2.50.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.

Standard Wiring, 1918 Edition, 24th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.

Wray's Manual of Car Lighting. Published in 1915 by Wray Publishing Company. 340 pages, illustrated. Price \$1.50.

Reasons for R. & M. Fan Reliability

Reason One — The Rotor

The induction type rotor of the R. & M. Fan is built up of steel laminations which are mounted on a substantial spider. The slots are skewed to give a uniform torque and quiet operation.

The rotor conductors are solidly riveted to the end with rings and soldered which insures uniform contact with all connections throughout the life of the fan.

A high grade hardened steel is used in the shaft and the journals

are accurately ground to the guage, insuring smooth operation, and long life for the bearings. A groove in the shaft just inside the journals prevents the oil from running along the shaft into the stator windings.

Every rotor is carefully balanced to eliminate vibration and insure smooth operation.

Under ordinary conditions every R. & M. Rotor is good for a lifetime of service.

For individual room heating

Your great economy problem this Fall and Winter will be the low cost of heating your home. Whether your present heating system is the old-fashioned coal heater or the modern hot water system it can be regulated to conserve fuel. But in doing this, all the rooms are not being properly heated.

The Hughes Electric Air Heater is an auxiliary heater which acts as a fill-in and makes this fuel conservation possible. The heat is instantly regulated to the requirement which makes it ideal for individual room heating. Portable, and can be moved from room to room—quickly warming it to a comfortable temperature.

It's a wonderful convenience these cold mornings, giving heat when you want it and where you want it. Especially in the Spring and Fall or on an extremely cold day when there is just a little more heat needed to make it comfortable. At the turn of a switch you have the necessary heat without the noxious fumes that wither plants, or the fire hazard, ashes and smoke with the worry of keeping things clean. When not in use can be stored in a small space. Built with steel body, cast iron base—will last for years. Finished in black enamel and nickel trimming.

No. 2

Electrical Progress in 1918

Following their usual custom, the Westinghouse company have prepared a comprehensive resume covering the various items of electrical manufactured articles in which marked development has been noted during the recent past. Naturally, and essentially, developments have been restricted along lines best suited to the prosecution of the war, but since this has called for a vast amount of manufactured products, it follows also that this development can now be utilized almost equally well in peace industries. There has not, of course, been the same incentive to introduce economies since speed has been the dominant note in all war work. From now on we may naturally expect, therefore, that inventions and improvements in equipment will follow slightly different lines, having in mind the necessity for greater economies forced upon us by high labor costs, high cost of materials and keen foreign competition.

Electricity has played a big part in the propulsion and operation of submarines and in radio work. The later types of airplanes carry generators for the latter purpose. A wonderful extension of the use of electric furnaces is also noted. The figures for England show that the capacity has been doubled many times since war broke out and when the facts in enemy countries come to be known it is anticipated that a similar situation will be found there. Arc welding also has had a much wider application, being used in shipbuilding and in manufacturing industries using iron and steel. Recently a large electrically welded rivetless ship was turned out in

England, and another is building. Electric drive has also made considerable progress in the refrigerating and ice-making industry, due to the fact that it is very much cheaper to make ice in electrically-driven plants as plants now equipped with electric motors are making ice at an electric consumption of 42 kw.h. per ton. Another very utilitarian use to which motor drive has been applied is in the operation of electric shovels. A splendid example of this is the large Bucyrus machines used by the Ontario Hydro on their Chippewa Canal excavation. An order was also placed for the largest electric generator to date for use at Niagara Falls—on the U. S. side—a 32,500 kv.a. machine, and the near future will see a call for tenders on one or more 45,000 kv.a. generators for the Chippewa plant.

Municipal Engineers Meet Jan. 30-31

Our readers are again reminded that the winter convention of the Association of Municipal Electrical Engineers is scheduled to meet in Toronto, Thursday and Friday, January 30 and 31. Mr. W. L. Goodwin addresses the convention on Friday morning. Other interesting features of the two days' programme, as outlined in our issue of January 1, are: an address by Mr. W. B. Johnson, of Montreal; an oscillograph talk by Professor Price; and a paper by Mr. A. S. L. Barnes. The dinner, which is scheduled for Thursday evening, will probably be held at the Carls-Rite Hotel, though this will be announced later. The after-dinner speaker is Mr. C. H. Hopper, of the Canadian Westinghouse Co. Commercial companies are again reminded that whether they have availed themselves of becoming members of the association or not, they will be welcomed at the convention. Members and visitors are requested to register during Thursday morning at the Hydro Offices, University Avenue.

Water Powers of the Province of Quebec— Hamilton Falls a Million H. P.

The Department of Lands and Forests of the Province of Quebec have issued a booklet describing the water powers of the Province of Quebec, written by Arthur Amos, chief engineer, Hydraulic Survey. This information was gathered for the purpose of giving the Dominion Royal Commission, which sat in Quebec, in November, 1916, a general idea of the importance of the water powers of the province, and of their remarkable location throughout its extent, and is a translation from the French, in which the information was originally compiled. It is stated that a recent census of the operating hydraulic plants of the province has revealed the fact that the total capacity of these plants exceeds 825,000 h.p. The total horse-power of the province is probably somewhere in the neighborhood of 6 or 7 million, much of which, of course, is not so located that it can be of any immediate commercial use. As an example, there is the great fall of the Hamilton River in the extreme northeastern portion of the province, which is rated at 300 feet, but from which, according to Mr. Thibaudeau, C.E., who explored this region in 1914, a head of 960 feet, and a capacity exceeding one million h.p. could be obtained by means of a dam and diversion canal, through a chain of communicating lakes in the

vicinity. The following conclusions, summing up the water power situation in the province, are of interest:

The Province of Quebec is well provided with water-powers, but most of the falls are not of great height.

It should be observed that the sites where considerable energy (over 50,000 h.p.) can be produced, and still in a natural state, are remarkably situated for supplying the wants of the principal cities. Thus, for the vicinity of the city of Ottawa, we find the Chats falls and other rapids of the Ottawa river, for Montreal, besides the sources of energy now in use, the rapids of the St. Lawrence at Cotéau, Les Cedres, and also the Sault-Saint-Louis; for Trois Rivières and Quebec, the water-powers of the river St. Maurice, regulated by the largest reservoir in Canada, at La Loutre; for the Saguenay and Chicoutimi region, the rapids of the Grande-Decharge; lastly, for the Lower St. Lawrence, the falls of the Manicouagan and of the River Aux Outardes.

The south shore of the St. Lawrence is not so well provided, but it may be said that for the more densely populated regions, that is to say, the Eastern Townships, the St. Francois River, when regulated, will suffice for the demand, for a good many years.

The advantages of the lake Saint-Jean region and, particularly those of the Grande-Decharge should be especially emphasized. The natural conditions there are remarkable; the available undeveloped power is enormous; ocean navigation is possible almost as far as the spot where the works could be erected; there is no lack of labor and a railway connects the district with Quebec and Montreal, as well as a steamer line.

Lastly, we would say that the Quebec Streams Commission, acting under the jurisdiction of the Provincial Government, has taken in hand the improving of the regimen of rivers on which industries are established. Great advantages are anticipated from this policy and everything tends to show that, within the next decade, the work of this body will produce all the good results expected from it.

Electric Steel Furnaces in England—Heroult Furnace Finds Widest Use

In a recent paper at the Staffordshire Iron and Steel Institute, F. J. Moffett gave the following figures relating to electric furnaces installed in the United Kingdom at the end of 1917. Of the total (140) nearly one-half were in the Sheffield and Rotherham district, where there have been such vast extensions in the iron and steel industries and in the applications of electricity in connection therewith consequent upon munitions and shipbuilding demands:

Heroult	46	varying from $1\frac{1}{2}$ —10	tons
Greaves-Etchell	31	varying from $\frac{1}{2}$ — $12\frac{1}{2}$	tons
Electro-metals	27	varying from $1\frac{1}{2}$ —10	tons
Rennerfelt	8	varying from $\frac{3}{4}$ — $2\frac{1}{2}$	tons
Stobie	6	varying from 5— $15\frac{1}{2}$	tons
Other makes	22		

Mr. Moffett said that the arc furnace had established its superiority from a commercial point of view, the induction furnace now being very rarely used in England for steel refining.

The standard sizes of furnace with the transformer capacity and the approximate units per ton of finished steel were:

Size.	Transformer capacity.	Kw.h. per ton
2800 lb.	300 Kw.	850
$2\frac{1}{2}$ tons (long)	500 Kw.	800
5 tons (long)	800 Kw.	750

The decrease in the kw.h. per ton does not go on indefinitely; when the capacity of 15 tons is reached, the kw.h. per ton appear to reach their minimum value.

Congratulations to Lieut. M. B. Hastings, M. C.

The welcome news has just recently reached Toronto friends that Lt. M. B. Hastings has been awarded the Military Cross for conspicuous bravery on the field. This information is contained in a letter to Mr. A. H. Winter-Jóyner from which are quoted extracts. It will be noted that Lt. Hastings has lost nothing of his old-time modesty. Congratulations on his splendid showing. The letter runs as follows:

Cambrai, Oct. 9, 1918.

We have just captured Cambrai and three hours ago the old Hun was here. He isn't now and our troops are over a thousand yards the other side of the city. My old battalion (4th C.M.R's.) mopped up the city. The artillery barrage was a hummer. I think if Fritz could get behind our lines on a sight-seeing expedition to see what we have, he would quit right away.

Well, people, I'm in a hurry because we are going right on. This is the greatest experience of a generation, if you don't weaken.

Now, Alf., you know how modest I am, but to-day I got the surprise of my life when the O. C. sent a list to me showing the decorations awarded by the King for the battle of Amiens. I took the Mobile Mortars over with the Infantry, but just had a good time, of course, lots of excitement, but I never lost out on beating anyone into a shell-hole. By jove, I'm glad I can yet move fast. However, I don't know why, what for, or anything else, but the orders actually read "Lt. M. B. Hastings awarded the Military Cross." I must have been shooting the Hun an awful line of Bull, Eh!

However, it's encouraging to be decorated, although nothing was farther from my thoughts. I didn't even know I was recommended for the M. C. and I can hardly believe it. I will be invested with the medal by the King next time I'm on leave in London. It will be nice to have A. H. W. J. Ltd., represented on the list of decorations as well as the list of soldiers, Eh!

Later I was called back to-day and the O.C. subjected me to the awful ordeal of standing in front of the parade, while he made some foolish remarks and pinned the ribbon on. However, I guess it's true now, it's beginning to seem real.

An interesting sequel to this is contained in a note just received by friends of Capt. Gordon C. Patterson, also of M. C. fame, who writes from Bruhl, Germany, under date December 11, 1918:

"Here we are in Germany only a few miles from the Rhine. This is a picture of the 'villa' in which our office and mess are. Bruhl lies on the outskirts of Cologne. The day before yesterday I was through Cologne on one of our staff cars and crossed the Rhine, on the Hohenzollern Bridge, returning by the South Bridge. Cologne is quite a wonderful city (650,000 inhabitants); the Cathedral is a fine building. You may realize that my knowledge of German is an invaluable asset just now. I will go forward with another staff officer to-morrow morning and we will ride across the Rhine and have a look at the territory on the other side.

"When you realize that our troops have covered 300 miles on foot since the armistice was signed; you will see that they have not been exactly resting. But everything has been well arranged and the progress has been gradual but steady. After the hardships of the war, it is great—I can't hope to depict how happy our fellows are, to be doing this instead of fighting. This Eifel region between the Rhine and Belgian frontier is one of the most beautiful in the world, and touring about on a car has been a great contrast to the life of the last three years. A tramway runs regularly from here to Cologne and it is only a short trip to the heart of the city."

Bell Telephone System Announces Perfection of Invention Which Admits of Five Conversations Simultaneously Over a Single Pair of Wires

The Bell Telephone System have announced the solution of one of the most difficult problems in telephony and telegraphy. This problem has been before telephone and telegraph engineers almost since the existence of the telephone and the telegraph. It has remained, however, for the engineering departments of the American Telephone & Telegraph Company and the Western Electric Company working together to solve it. Its solution has required the very highest inventive and engineering skill and the technical staff who have worked on it so successfully are entitled to the very greatest credit for their work.

The practical demonstration of this system was made upon a pair of wires extending between Baltimore and Pittsburgh. Everyone knows of the great demands which have been made by the Government and the public for long distance service since our entry into the war. Naturally, the demands for long distance business in and out of Washington were greater even than the demands elsewhere. It was, therefore, decided last spring when this system was ready for practical trial to make it in such a location that the additional facilities provided would be available in assisting in carrying the war load of long distance traffic in and out of Washington.

A pair of long distance wires extending from Washington to Baltimore and thence via Dallastown to Pittsburgh was selected for the experiment. The multiplex system was applied only to that part of the circuit extending between Baltimore and Pittsburgh, as for the part between Baltimore and Washington additional wires were available in the cable. Before applying the new system the pair chosen between Baltimore and Pittsburgh was operating as follows: In addition to carrying a telephone circuit of the usual type each wire of the pair was equipped with composites for duplex telegraph working and, further, that portion of the circuit from Baltimore to Dallastown was combined with another pair into a phantom telephone circuit. Without disturbing the working of any of these arrangements, by means of our multiplex system we superimposed on the wires in question four additional telephone circuits together with the complete signalling arrangements necessary to operate them. Both the talking and signalling on these new circuits provided by means of the multiplex were as good as the original telephone circuit provided in the ordinary way. These circuits were placed in regular service during October of this year being terminated on the toll switchboards at Washington and at Pittsburgh in the usual manner and being as far as the operators were concerned exactly similar to ordinary telephone circuits. Since October they have been used interchangeably with the regular telephone circuits in handling the traffic and this experience showed in actual service that the new circuits were as good as the circuits provided by the usual plan of working, a result which we had confidently expected from our earlier tests.

It is difficult to explain in non-technical language how it is possible to carry on five telephone conversations simultaneously over a single pair of wires. It is necessary to send over this pair of wires five different electric currents at the same time and to provide means so that at the ends of the pair of wires these currents may be completely separated from each other so that each current coming from one particular telephone at one end may go to a particular telephone at the other end, although on the toll line the five currents have all been mixed together. The problem is to so modify each

current before it goes on to the multiplex part of the circuit that each current while preserving its ordinary characteristics has imposed upon it a new characteristic which will enable the apparatus at the receiving end of the circuit to distinguish the currents from each other. This is done by combining each ordinary telephone current with a carrier current of definite higher frequency. The frequency or the wave length of each of the carrier currents is different from that of the other carrier currents used on the same pair of wires and is adjusted to the separating devices at the distant end of the line.

The underlying principle may be illustrated by considering a composite photograph of five individuals. Given such a composite photograph of the ordinary kind it would obviously be impossible to derive from it the picture of each of the five individuals going to make it up. If, however, the composite photograph had been made up in five different colors the picture of each individual being in a different color, it would then be possible, by looking at the picture through colored glasses to see any one picture, separate from the others. If red glasses were used the picture printed in red only would be seen; if blue glasses the picture in blue, etc., although when looking at it in the ordinary way all of the pictures would be seen together and only the combination would appear. As the tint of each picture serves as a means of differentiating it from the others so the frequency of the carrier currents serves to differentiate each of the conversations in the new telephone multiplex.

Naturally to accomplish these results considerable amounts of apparatus are required at the terminals of the multiplex line, and there is also required changes and rearrangements in the wires themselves. It is for this reason that the system, while physically applicable to wires, either long or short, is economically limited in its usefulness to long wires. On subscribers' lines or on short local or suburban trunks its costs and complications would not be justified. On long toll wires, however, it has without doubt an important field of application.

When in the future the history of the development of the telephone and telegraph art is written, our new multiplex telephone and telegraph system will occupy a most prominent position, both on account of the skill and the ingenuity which have been shown in its solution and the results which, as years go by, will arise out of its applications.

I am glad here to have the opportunity to express my appreciation of the brilliant work of hundreds of the men on the technical staff of the Bell System whose combined efforts have produced the multiplex telephone and telegraph system the success of which has recently been so strikingly demonstrated.

The O'Brien Power, Pulp & Paper Co., Ltd., with a capital stock of two million, five hundred thousand dollars, takes power to develop, operate and maintain water powers for the manufacture of electric power, and the right to sell and distribute any surplus power in the county of Temiskaming, Province of Quebec.

During the past year the earnings of the Marconi Wireless Telegraph Co. of Canada advanced from \$104,929 to \$114,953, the balance carried forward being \$198,414. Mr. J. W. Greenshields, K.C., succeeds Mr. A. Allan as president, Major Thomas Robb being appointed managing director.

In connection with a by-law passed by the town of Alvinston, Ont., to purchase the plant of the Alvinston Power Company, as noted in our last issue, a quantity of material will be required by the Hydro-electric Power Commission in connection with remodelling the plant.

*By Bancroft Gherardi, Acting Chief Engineer, American Telephone and Telegraph Company.

Power-Factor Clauses in Contracts

U. S. Practice to Charge on Maximum Demand—In Canada According to Average Power-Factor

Only in very recent years have central stations and power supply companies in general come to realize that one of the greatest enemies of efficient operation is a lower power factor. Or if its full significance has been realized it has been looked upon as a necessary evil. Certain customers' loads had, of necessity, a low power factor, over which, it was conceded, the power supply company had no control. Gradually, however, it has come to be realized that by a close co-operation between the company and the consumer, some, at least, of the difficulty can be remedied. And so it has come about that the responsibility of maintaining a fair power factor is now frequently placed at the door of the consumer, the endeavor sometimes taking merely the form of an educational campaign, but at other times, the more tangible and, we believe, more effective form of a penalty clause which the customer may incur, or not, in proportion as he uses care in the utilization and distribution of his power requirements.

The power factor clause takes various forms which will, no doubt, become more or less standardized as the situation clarifies. However, at the moment, they are legion and a most interesting review of the wording of the clauses, as used by various companies, is contained in a paper by Mr. Will Brown, in a recent issue of the *Electrical World*. Mr. Brown has used examples from both Canada and the United States and writes as follows:

Formerly power systems were built on a larger scale than the market at the time required, consequently their problem was to build up a load for their generators. At the present time, however, the demand for power has outrun the supply, and the acute conditions caused by low power-factor have come on in some cases very rapidly.

Power-factor regulations are by no means a new thing. They have been carried in contracts by different companies throughout this country and Canada for several years, but very seldom indeed have they been rigidly enforced. Questions involved so much explanation to the power customer and the whole thing was so complicated from the standpoint of accurate metering that the clauses soon became "dead letters." They did, however, serve the purpose of a club in the hands of the power company to enforce reasonable power-factor from the customer. It seems to be the opinion of many central station men that power-factor penalty clauses can only be used in this way, and that there can be no accurate method of grading rates according to power-factor maintained.

Opposed to this view are many prominent central station managers in this country and Canada, who claim they have proved by experience that they can accurately measure the average power-factor of a customer's load and charge on this basis. They claim that the matter of power-factor, although a very different thing from load-factor, is just as important in basing alternating current rates.

The case resolves itself to this: There are power consumers who do maintain good power-factor. There are consumers who do not maintain good power-factor, but who will make a reasonable effort to better their conditions if proper inducements are made. There is a third class of consumers who either by choice or necessity will not make an effort to better power-factor conditions. Is it fair for the central station to make the good customer carry the burden imposed by the bad customer?

Various opinions have been expressed on this subject, some of which are given here. The following is an extract

from a recent report of the Canadian committee on rate research, prepared in view of the shortage of power and the high cost of machinery to carry increased demands:

Whereas in the past power-factor clauses have not been vigorously applied, nowadays nearly all companies are requiring the customers to keep their power-factor within reasonable limits at all times and to pay for any deficiencies. The question of the measurement of power-factor as to whether same should be computed to the time of maximum load of the customer's installation or to the time of maximum load of the company's system, or whether the average power-factor taken by the customer of the whole period of his operation should be taken as the determining factor, is not yet standardized.

The committee of the Canadian Electrical Association on commercial light and power sales says:

The power shortage has called to the attention of the companies suffering from it the necessity of being much more careful in their sales of power and the conditions of sale, among which perhaps the most important is the regulating of power-factor. In the past, owing to loose power-factor conditions and non-enforcement thereof, power lines have become encumbered with motors of excess capacity or of improper voltage, or improperly repaired, with the result that many companies were supplying motor loads at a very low power-factor, materially decreasing their line capacity, their generating station capacity and transformer capacity, all of which is so urgently needed at the present time.

Most companies throughout the country are now strictly enforcing their power-factor regulation clauses, or writing in new power-factor clauses in their new contracts, with the result that the users of power, owing to penalties imposed for poor power factor, are readjusting their equipment to operate at a proper and reasonable power-factor, which has worked very much to the benefit of the central station and of the consumer.

The Southern Wisconsin Power Company specifies that where the power-factor is below 90 per cent. it will add to the number of actual kilowatt-hours an amount sufficient to make the total kilowatt-hours equal to 90 per cent. of the total of the apparent kilowatt-hours.

This is an interesting clause because of the fact that it actually charges on the basis of kilowatt-hours at a specified power-factor. Nearly all of the power-factor clauses relate to the maximum demand charge entirely and ignore the energy charge.

Typical Power-Factor Clauses.

The following are some typical clauses from power contracts:

Cleveland (Ohio) Electric Illuminating Company.—When the current supply is alternating and the greater part of the load is power and the billing demand exceeds 75 kw., the company reserves the right to test the power-factor of the consumer's load, and if the average power-factor is greater than 75 per cent, then the demand shall be reduced in accordance with the following formula: Billing demand = kilowatt demand as measured $\div$ average per cent. power-factor $\times$ 75.

If the average power-factor is less than 60 per cent., then the demand shall be increased in accordance with the following formula: Billing demand = kilowatt demand as measured $\div$ average per cent. power-factor $\times$ 60.

The company will make without charge a power-factor test at the consumer's request once a year, if his demand exceeds 75 kw. By power-factor is meant the average power-factor under normal operating conditions.

Niagara, Lockport & Ontario Power Company.—The purchaser shall at all times take and use the three-phase power in such manner that the power-factor will be as near 100 per cent. as possible, but whenever at any time the current is not taken at 100 per cent. power-factor and the power-

factor is less than 90 per cent., then the basis of charge for that day, in lieu of the highest one-minute demand, shall, if the power company so elect, be considered as 90 per cent. of the maximum k.v.a. taken for a period of one minute divided by 0.746. This amount shall never be considered as less than the fixed horse-power agreed to be purchased and paid for.

Northern Indiana Gas & Electric Company.—The primary charges will be increased by 1 per cent. for each 1 per cent. the power-factor on the entire load decreases below 75 per cent. at any time. If the power-factor on the entire load, owing to lagging current, is maintained at 95 per cent. or better, a discount of \$1 per kilowatt per year will be made from primary charges.

Harrisburg (Pa.) Light & Power Company.—The consumer shall at all times take and use power in such manner that the power factor shall be as near 100 per cent. as possible, but when the actual power-factor is less than 80 per cent., then the demand to be charged and paid for shall be obtained by multiplying the demand shown by the meter at the time of measurement by 80 and dividing the product thus obtained by the actual power-factor.

Milwaukee (Wis.) Electric Railway & Light Company.—The customer agrees that when possible the average power-factor of the equipment to be supplied with electric energy hereunder shall not be less than 80 per cent. Should the power-factor of the electric current taken by the customer at any time be less than 80 per cent., then the maximum demand as specified herein shall be ascertained and determined as 0.00080 of the product of the maximum average amperes taken by the customer for fifteen consecutive minutes multiplied by the volts and the factor 1.73.

Duquesne (Pittsburgh) Light Company.—Where the power-factor of the customer's load is below the sub-joined schedule of permissible power-factors the company reserves the right to increase the demand as estimated or measured in the ratio that the actual power factor as determined by test bears to the permissible power-factor:

75 p.c. power factor for demands from 10 kw. to 50 kw.
80 p.c. power factor for demands from 50 kw. to 250 kw.
85 p.c. power factor for demands from 250 kw. to 1000 kw.
90 p.c. power factor for demands above 1000 kw.

Companies Controlled by the United Gas Improvement Company (Philadelphia).—The primary or demand rate for any month shall be increased 1 per cent. for each 1 per cent. the lagging power-factor on the consumer's load is at any time during such month below the following: 75 per cent. at the time of maximum demand, 70 per cent. at the time of 75 per cent. of maximum demand, 65 per cent. at the time of all other demands.

If the lagging power factor on the consumer's load is maintained at all times during the month at 95 per cent. or better, 10 cents per kilowatt per month of demand will be deducted from the primary or demand charge.

Philadelphia (Pa.) Electric Company.—We penalize a customer for a power factor below 80 per cent., correcting the stand-by charge to 80 per cent. basis.

Toledo (Ohio) Railways & Light Company.—The maximum billing demand shall be determined from actual measurements of the customer's demand and a consideration of the power factor at which these measurements are taken and shall be calculated by multiplying the greatest integrated fifteen-minute demand by 80 per cent. divided by the actual power factor at which the demand measurements are taken.

Basing Charge on Average Power-Factor.

In all of the above contracts the maximum-demand charge only is involved. In Canada, however, central stations have actually been basing their energy charge upon the average power-factor of the load. The following clauses are examples of Canadian practice:

Montreal Light, Heat & Power Company.—The minimum power factor of the electrical energy taken shall not be less than the following:

Motors and apparatus of 3 hp. rated capacity and less, 70 per cent.; over 3 h.p. and not exceeding 5 h.p., 75 per cent.; over 5 h.p. and not exceeding 10 h.p. 80 per cent.; over 10 h.p., 85 per cent.

If the power factor of the electrical energy taken is found to be less than as specified above, then consumer shall pay for the electrical energy taken on the basis of the minimum power factor so specified.

Southern Canada Power Company, Ltd.—If the power

factor of the electrical energy taken is found to be less than 85 per cent., then consumer shall pay for the electrical energy taken on the basis of 85 per cent. power factor.

Toronto Power Company.—The purchaser agrees to use the three-phase electrical energy in such a manner that the current values, as determined by suitable current indicating or recording devices, for the three phases shall be balanced each with the others to such an extent that the difference between the lowest and the highest coincident current values shall not be greater than 5 per cent. of the lowest current value; and that whenever a current unbalance providing a difference in excess of 5 per cent. shall occur in the manner hereinbefore stated, then the amount of power may at the option of the power company be taken as 90 per cent. of 1.73 times 95 per cent. of the highest of the three current values multiplied by the highest phase voltage coincident with the current value used.

The current and voltage are to be determined by commercial instruments meeting the requirements of the Department of Inland Revenue for Canada.

The purchaser agrees to use the three-phase electrical energy in such a manner that the power factor shall be 90 per cent., and that whenever the said power factor shall be less than 90 per cent., then the power company may take 90 per cent. of the k.v.a. as the rate of taking power and use the same in determining the demand rate or the energy consumption.

Fundamental Difference Between the Two Clauses.

The basic differences between these two types of clauses should be carefully noted. In one case the maximum demand as metered at infrequent intervals varying from once a month to once a year is increased according to the amount of power-factor drop below a certain specified minimum. In the second case every kilowatt-hour of energy as metered by the watt-hour meters is increased in proportion to the amount of power-factor drop below a specified minimum. It is plain that while the former method could be enforced with a fair degree of accuracy, it would not in any way take into account the average power-factor of the customer's load.

It may be argued that the central station is only interested in knowing the customer's power-factor at full load because at periods of light load the system could be operated at lagging power-factor without great inconvenience. But it does not always follow that the periods of light load of the consumer coincide with periods of light load on the system. They may occur at the time when the system load is at the peak.

Mr. G. M. Bertram, appointed Sales Manager for the Lincoln Electric Co.

The Water Powers of New Manitoba

Government Investigating Supply for Mining Operations and Other Demands— Four Rivers of Considerable Capacity

An interesting pamphlet has just been issued by the Natural Resources Intelligence Branch of the Department of the Interior, entitled "The New Manitoba District, Its Resources and Developments." A chapter relating to water powers is of special interest to our readers, and we reproduce the following extracts. It must be remembered that these remarks apply to the new area which was added to Manitoba in 1912, comprising 178,000 square miles, frequently spoken of as New Manitoba. The data for this chapter was compiled by C. H. Atwood, of the Dominion Water Power Branch, Chief Engineer in charge of Alberta and Saskatchewan Power Survey.

Water Powers.

Owing to its remoteness from any regular line of transportation, it was soon realized that if mining operations were successful in the new Mineral Belt, a supply of hydro-electric power, sufficient to meet all possible demands, was one of the most important requirements of the district. This being the case, engineers of the Dominion Water Power Branch of the Department of the Interior were directed to investigate the district, and during the summers of 1915 and 1916 made reconnaissance power surveys of the Grass and Burntwood rivers to the east, and of the Sturgeon-Weir and Churchill rivers to the west and north. The results of these investigations showed that the power sites lying in closest proximity to the Mineral Belt and capable of producing large quantities of power (blocks of 5,000 horse-power and over) were Birch rapids on the Sturgeon-Weir river and Island falls and Bloodstone falls on the Churchill river.

At this time, owing to the lack of stream flow records, no reliable estimate can be made of the continuous power output of these sites. The discharge measurements obtained during the power investigations are the only records available to date (January, 1918). However, the Department, realizing the need of winter records, has despatched an officer of the Irrigation Branch to secure as many discharge measurements as possible this winter on the Sturgeon-Weir and Churchill rivers. These measurements, while not sufficient, will nevertheless provide data from which an approximate estimate of the continuous power available on these two rivers can be made.

The lack of information makes it difficult, at the present time, to summarize the water-power prospects in this district in a satisfactory manner but, in order to render the general situation more clear, a brief outline of the power possibilities on the individual rivers investigated is appended. The power estimates are subject to revision as further data becomes available.

The Burntwood River.

The power investigation on this river covered the reach from Split lake up to Gate rapids, a distance of 140 miles. The river flows, generally without apparent current, through a well-defined valley, and for the most part the banks are of clay. The channel is wide, often expanding to lake dimensions, and sand bars or flats are not uncommon.

In the reach between Split lake and Three Point lake there is a total drop of 237 feet, concentrated for the most part at six falls and ten rapids. The most important power possibilities investigated were: Manaza falls, with an almost vertical drop of 26 feet; Jackpine falls, with a drop of 29

feet; Taskinigup falls, with a descent of 53 feet; and Wuskwatim falls, with a total descent of 24 feet. The two latter falls are located only one-half mile apart and might well be combined in one power scheme. Wuskwatim lake affords a large storage capacity, and is conveniently situated.

Discharge records were obtained during the survey, and from these it is estimated that the minimum flow is approximately 500 second-feet, and that for nine months possibly 750 second-feet can be obtained. The power available, as shown in the following table, is based upon this estimated flow and the head given at the sites, assuming a turbine efficiency of 80 per cent.

Table I.

Power site	Head in feet	Discharge in second-feet		Horsepower	
		Minimum	Dependable for 9 months	Minimum	For 9 months
Manaza Falls . . .	26	500	750	1,182	1,800
Jackpine Falls . . .	29	500	750	1,318	2,000
Taskinigup Falls . .	53	500	750	3,455	5,200
Wuskwatim Falls . .	23				

The Grass River.

Grass river forms a part of the great Nelson River drainage system and lies entirely within the province of Manitoba. From its source in the Cranberry lakes, near the Saskatchewan-Manitoba boundary, the Grass river flows in a northwesterly direction for about 275 mile before joining the Nelson, a few miles above Split lake.

The drainage basin comprises an area of approximately 6,400 square miles, and the general relief of the whole district is low and unpronounced. The rock is of Laurentian formation, but in many sections is overlain with considerable depths of clay or drift, and is claimed to be very suitable for agricultural settlement. The entire basin is more or less wooded with spruce, poplar, and pine, very little of which is of sufficient size for building purposes, though the spruce and poplar is large enough for pulp manufacture.

The river passes through many lake expanses, several of which should afford satisfactory storage. Hekusko lake with an area of 70 square miles, Sandy lake with an area of 12 square miles, Setting lake and adjoining lakes with a combined area of 85 square miles, can all be utilized and would provide a fairly complete regulation of the water supply.

The investigations covered that portion of the river lying between Reed lake and Split lake, or approximately 250 miles. In this reach there is an aggregate drop of 365 feet, occurring mainly at twenty-four rapids and nine falls. It is not economically possible to utilize this entire drop for power purposes, but at six sites it would be possible to concentrate 270 feet. The following table gives the location

Table II.

Power site	Head in feet	Discharge in c.f.s.		Horse-power	
		Estimated minimum	Dependable for 9 months	Minimum	For 9 months
Wekusko Rapids . .	55	100	150	500	750
Second Falls . . .	42	150	225	570	905
First Falls	37	175	265	590	900
Lynx Falls	54	350	525	1,720	2,577
Sandy Falls	46	350	525	1,465	2,200
Fifth Rapids	36	400	600	1,310	2,000
Total	..	..	..	6,155	9,332

of these six sites, estimated minimum flow, available head, and the power output at 80 per cent, turbine efficiency. Owing to the insufficient data relating to run-off, no attempt has been made to estimate the power output with proper storage regulation. It is apparent, nevertheless, that with the large drainage area, the mean discharge should be considerable and that power development at any of the sites along the river will be greatly improved by the utilization of the storage opportunities.

The Sturgeon-Weir River.

The Sturgeon-Weir river drains the large system of waterways lying in northern Saskatchewan, including Deschambault, Wood, Pelican, and Mironde lakes, and empties into Amisk (Beaver) lake which lies about 60 miles north-west of The Pas, Manitoba. The river from Mironde lake to Beaver lake is approximately 50 miles in length, and from Beaver lake to Namew (Sturgeon) lake, locally known as the Sturgeon river, is an additional 27 miles.

Between Mironde lake and Beaver lake there is an aggregate drop of approximately 60 feet, occurring mainly at six rapids. Of these rapids there is only one at which it is possible to develop, economically, sufficient power for the probable power demands of the Northern Manitoba mineral belt. This power site is at Birch rapids, about 17 miles below the outlet of Mironde lake and some 35 miles distant from Flin-Flon lake. At Birch rapids there is a natural drop of 11 feet, the river narrows to a width of 150 feet, and both banks, which are of granite and quite steep, rise to a height of 50 or 60 feet above the river. A head of 30 feet can easily be obtained at this point. The natural discharge of the river is insufficient to meet the possible requirements of the mining district, and it is only in conjunction with a complete system of storage and regulation, together with a possible diversion of Churchill waters at Frog portage, that 20,000 or 25,000 continuous horse-power can be made available at this site. Mironde, Pelican, Deschambault, and Burntwood lakes with a combined area of approximately 360 square miles will provide the bulk of the storage required.

The Churchill River.

The Churchill River basin comprises the watershed lying immediately northward of the watershed of the Saskatchewan and Nelson rivers, and drains into Hudson bay. The total area of the basin is approximately 114,150 square miles, the axis being practically east and west, extending westward to the height of land dividing it from the Athabaska. Innumerable lakes of varying size occur throughout the whole basin, and the river itself to within 80 miles of its mouth may be described as a chain of lakes linked up by short stretches in which rapids and falls occur.

Throughout its entire length the Churchill provides numerous power and storage sites which will warrant very careful investigation. Certain of these power sites may possibly play a most important part in the development of the new Mineral Belt of northern Manitoba and Saskatchewan. There are two power sites located within reasonable transmission distance of the mining district. These sites are Bloodstone falls, situated at the lower end of Sisipuk (Duck) lake approximately 17 miles east of Island falls, and approximately 10 miles due west of the Manitoba-Saskatchewan boundary.

At Bloodstone falls there is a natural drop of 10 feet, and a head of 20 feet can easily be obtained; this would create a pond of roughly 90 square miles. From the meagre discharge data available it appears that 27,300 continuous 24-hour horse-power can be developed without utilizing the storage available. For eight months of the year possibly 36,000 horse-power can be developed. This power site is

distant about 80 miles, in a direct line from the mining district.

At Island falls, approximately 60 miles in a direct line from the mining district, there is a natural drop of 17 feet, and a head of 36 feet can be created which, under conditions of natural flow, would possibly develop between 40,000 and 50,000 continuous 24-hour horse-power. For eight months of the year possibly 65,000 horse-power can be developed.

The following table briefly summarizes the present estimate of the power available adjacent to the mining district and is subject to revision as further data is received.

Table III.

Power site	Head in feet	Estimated minimum discharge in c.f.s.	Horse-power, continuous 24-hour power	Distance* to mining district in miles
Burntwood River—				
Manaza Falls	26	500	1,182	160
Jackpine Falls	29	500	1,318	150
Tasinigup Falls	53	76	500	135
Wuskwatim Falls	23			
Grass River—				
Wekusko Rapids	55	100	500	70
Second Falls	42	150	570	90
First Falls	37	175	570	100
Lynx Falls	54	350	1,720	135
Sandy Falls	46	350	1,465	145
Fifth Rapids	36	400	1,310	170
Sturgeon-Weir River—				
Birch Rapids	30	7,000	20,000	35
Churchill River—				
Bloodstone Falls: . . .	20	15,000	27,300	80
Island Falls	36	15,000	49,000	60

Personal

Mr. Frank Down, Winnipeg and Western sales manager for the Canadian Tungsten Lamp Company, Limited, Hamilton, has been called to England, owing to the serious illness of his mother.

Mr. Wm. F. Kelly, Ontario sales manager for the Canadian Tungsten Lamp Company, Limited, Hamilton, left a few days ago for Winnipeg to call on the trade from Winnipeg west to the Coast. This trip was rendered necessary on account of Mr. Down's unexpected absence in England.

Mr. Meiji Nakao, chief electrical engineer for the Furukawa Mining Company, Tokio, Japan, has been visiting various points in Canada and the United States investigating electric furnace practice and was recently in Toronto. Mr. Nakao, who is also a large owner of mining interests in Japan, stated that they pay a half-cent per kw.h. for hydro-electric power at the mines.

Captain Alex. Wilson, of the 42nd Battalion R. H. C., who recently returned to Montreal, was the guest of honor at a dinner tendered him at the Engineers' Club, Montreal, on January 6th, by Mr. J. S. Norris, vice-president of the Montreal Light, Heat and Power Company. Captain Wilson was formerly engineer of the electrical distribution department of the company, and he expects within a few weeks to return to his former duties there. Members of the staff of the department were present at the dinner.

Obituary

Mr. James D. Fraser, secretary-treasurer of the Ottawa Electric Railway Company, died recently. He was also secretary-treasurer of the Ottawa Car Manufacturing Co., Ltd.

Mr. Henry McKay, chief engineer of the Pictou County Electric Company at New Glasgow, N.S., met death recently by electrocution while adjusting some apparatus in the power house.

Electric Railways

Toronto Railway Company are Equipping Their Entire System with Latest Type P-a-y-e Vestibules—Twenty Already Operating

The Toronto Railway Co., on January 6, inaugurated a modern pay-as-you-enter system on the College Street cross-town line of the city, to be followed as quickly as may be by a complete reconstruction of the rolling stock of this company throughout. The illustrations herewith are self-explanatory and indicate that the most modern ideas have been incorporated in the designs followed by this company.

The cars already equipped with p-a-y-e equipment, some twenty in number, have a platform length of 7 feet and are the latest type of car manufactured by the Toronto Railway Co. The line drawing herewith shows the actual dimensions of the vestibule. In the same figure is also shown the platform dimensions of the balance of the double-truck cars owned by this company, which are being equipped with the p-a-y-e system as quickly as they can be turned out. These latter cars will have a platform depth of 6 ft 6½ in. Either of these cars will thus have standing accommodation for from 12 to 15 people, which should be ample to take care of those passengers boarding the car at any point, who do not have a transfer or a fare so that they may pass right into the main body of the car.

It will be noticed that the vestibules are equipped with folding doors and folding steps. These are operated pneumatically by a touch of a lever convenient to the conductor. The conductor operates in a small railed-in compartment, as shown, roughly 3 ft. long by 2 ft. wide, which is equipped with the pneumatic lever just mentioned, p-a-y-e fare-box, and a push button to signal the motorman. The push button operates a signal light in the motorman's vestibule, which is normally burning and so indicates to the motorman whether the doors are closed, trolley pole on wire, current on, etc. The motorman will not start until the signal lamps light, and

throws off the power and applies the brakes when the signal light goes out.

The pneumatically controlled doors and steps respond to the motorman much more promptly than the manually operated type. Danger of the doors closing too rapidly and catching passengers in exit or boarding a car is obviated by two strips of rubber tubing attached to the doors and meeting as the doors close. Any object caught merely receives a slight pressure but no injury.

Doors open, showing Conductor's enclosure

Doors closed, steps raised

It will be noticed that the usual railing bar which divides the incoming passengers from the outgoing is not used in this new type. With the bar in place it has always been necessary for transfer passengers to pass around the conductor along with the cash or ticket passengers, thus tending to congest

Latest type p-a-y-e car now operating on system of Toronto Railway Company, Toronto

Plan of vestibule, twenty cars now operating p-a-y-e.

Plan of vestibule, earlier type cars now being remodelled

the passage and delay the schedule. With this dividing rail removed, the conductor will be able to accept transfers with his left hand and allow the transfer passengers to enter the car without passing around the fare box. This should tend greatly to diminish the length of stop at crowded points.

There are three illuminated signs on these new cars, consisting of a route sign over the front vestibule, a route sign in the second window from the rear of the car body, entrance side, and a designation sign located in the upper right hand of the front vestibule. These signs were designed and built in the company's shops. The large front route sign is particularly interesting, being fitted with a periscope arrangement which enables the operator to adjust the sign from the vestibule with absolute guarantee of the right route being indicated exactly in the center of the frame.

The front vestibule door moves on rollers and is manually operated by the motorman.

Another new feature about these cars is the p-a-y-e fare box. This is of the hopper type and is attached to the conductor's stand. One of the illustrations herewith shows different views of the box, which is designed by and built under the supervision of Mr. William Cox, who is in charge of fare collection devices for the company. The box is very much lighter and also very much smaller than the average p-a-y-e type of box and can be carried by the conductor or brought into the car just as readily as the old hand fare box. The

box is provided with a rocking or tilting arrangement by which the conductor, with a single simple forward movement, discharges the fares from the upper platform of the box into the main compartment below. The box cannot be removed from its stand without being given this rocking motion twice in succession, which insures that the conductor cannot re-

Fare box in stand

Fare box tilted to discharge tickets

Fare box removed from stand

View looking toward rear end, showing Conductor's enclosure and chain gate to prevent passengers crowding exit door

move the box from the stand without going through the motion which guarantees that all tickets are safely housed in the lower or storage compartment of the box. The company look upon this box as the most satisfactory and complete that has yet been produced on any of the p-a-y-e systems on this continent. Mr. Cox has invented a number of fare collecting devices and introduced a great many improvements in existing apparatus, having made the matter of efficient and safe collecting of fares a special study for years.

In the new cars the stove has been placed somewhat further out in the front vestibule, leaving a little more room for passengers leaving by the front door. The truck equipment on the latest type of Toronto car is Brill No. 27 K, with

4 ft. 6 in. wheel base. The motor equipment is G. E. through-out, consisting of four G. E. 80 motors, with K 35 controller. The cars are 44 ft. over bumpers, 30 foot body. They are equipped with Watson automatic fenders. The total weight is 41,000 lbs.

The new cars are the result of an investigation of the most efficient types on this continent, the good points of which have been brought together and incorporated on the Toronto Railway system by Assistant Manager Hubbard, Master Car Builder M. P. Powers, working with Mr. W. R. McRae, Master Mechanic and Superintendent of Equipment. Mr. R. J. Fleming is General Manager of the company.

The Problem Must Be Solved—Transportation Is a National Necessity—Railway Companies Must Have Relief*

In order to suggest a remedy for the conditions facing public utilities to-day, it is essential that there should first be a thorough understanding of the problems brought upon them by the war. These problems are clearly seen by the men responsible for the continuing operation of the public utilities under the increased demands for service due to the national crisis, and became more and more apparent as the nation's industries were mobilized on a basis of maximum efficiency for the prosecution of the war. The government authorities were promptly informed that if a breakdown in the essential service of public utilities was to be averted, four phases of the situation require speedy attention:

1. Rates must be increased sufficiently to absorb the increased cost of producing the service.
2. The utilities must be relieved during the period of the war, of all non-essential and unproductive requirements, such as paving, undergrounding of wires, duplication and unnecessary extension of service.
3. Some way must be found to enable the utilities to take care of obligations maturing while the war lasts.
4. Assistance must be provided to enable the companies to finance the unavoidable extensions of service made necessary by the nation's war program.

How these problems were met is now a matter of history. That they were not adequately met is recognized on all sides. Measures of relief were meager and too slow in coming. The needs of the industry were obvious, but no channels for immediate help were available. Proposals that offered hope were shrouded by constitutional doubts, and so one after another, the public utilities were forced into financial and operating difficulties, with the burdens of the war laid unrelentingly upon them.

It is to remove as far as possible a repetition of those conditions and to assure a safe future for the industry, and adequate service to the public that a readjustment of relationships is imperative.

One of the facts brought to the front during the last two years is that the whole structure of the franchise relationship between the public utilities and the various communities has broken down under the strain of war. The rapid increase in the cost of all material, the extraordinary demands of labor made necessary by the rise in the cost of living, the alarming decrease in the purchasing power of the dollar, have brought the industry, particularly the electric railways, face to face with bankruptcy, because no avenue of automatic escape from rising costs lay open.

Practically every industry, except public utilities whose rates are regulated by law, has been able readily to adjust its methods of doing business to meet the war demands, and the radical increases in cost of operations and of manufacture have been promptly reflected in the selling price and so on to the customer.

In all other departments of our commercial and indus-

trial life where the economic laws of supply and demand have been unhampered and allowed free play, the inevitable increase in the cost of production has been taken care of in the perfectly normal way of increased cost to the consumer. It is only in those industries where the public has attempted to fix a just and fair price for the service rendered and where the artificial standard has been substituted for the natural one that we find this complete breakdown under war conditions.

Industry generally was never so prosperous, notwithstanding the increase in the cost of labor and materials. The public utilities, on the other hand, present practically the one great exception to this rule of prosperity. These utilities have been nearly destroyed by the war.

Industry generally was never so prosperous, notwithstanding the increase in the cost of labor and materials. The public utilities, on the other hand, present practically the one great exception to this rule of prosperity. These utilities have been nearly destroyed by the war.

A tabulation of the income accounts of 388 electric railways, representing more than 63 per cent of the electric railway mileage of the United States, shows a falling off in net income of 82 per cent. for the first six months of 1918 as compared with the corresponding period of 1917. Many of the companies are facing actual operation deficit in spite of increases in gross receipts.

These facts lead inevitably to the conclusion that the present relationship between the companies and the public, as evidenced by existing franchises with fixed rates of fare, is economically unsound; that the present system of regulating rates by franchises or through commissions is admittedly not sufficiently responsive to the violent and radical changes in operating conditions which are bound to occur.

Another fact emphasized by the war is that before a company can justify an increase of its rates it must first show that for a longer or shorter period it has suffered loss under the existing rates, which loss cannot be compensated for by the new rates. In any other business the manager is able to provide against increases in cost by promptly advancing his selling price. The public utility must stagger along under inadequate rates for months until its credit is destroyed, its service impaired, its equipment deteriorated, and it has become obvious to the community that it is on the brink of destruction before its case has been sufficiently made out to justify an increase in its rate.

What are the Remedies?

The result of the extraordinary increases in the cost of labor and of material as well, coupled with the inability of the companies to increase their rates, is shown by the tabulation of operating figures of 63 per cent. of the electric railway mileage of the country, already referred to.

A careful study of these figures indicates that unless wise counsels prevail and the necessary relief is afforded electric railways in the near future, the industry, as an industry, is doomed to destruction. It needs no argument to establish the fact that no industry can continue successfully to function when deprived of the right to increase its rates to meet extraordinary increases in cost of operation.

What, then, are the remedies for the situation? Definite measures will suggest themselves as the problem is more thoroughly understood, but it is possible now to analyze the causes for the present situation and to suggest some of the basic principles which should control the relation of public utilities to their respective communities hereafter.

The chief difficulty has been that the viewpoint of both sides has been one of antagonism, instead of co-operation. Both the public and the companies have endeavored to obtain the greatest advantage for their respective interests,

*By P. H. Gadsden, Chairman Committee on National Affairs, American Electric Railway Association.

without considering the ultimate effect upon the industry or the community. The public, under the conviction that enormous profits were being realized, felt free to make one exaction after another, recognizing no interest in the public utility except the service rendered, and no responsibility for financial results. The companies, on the other hand, with no adequate appreciation of their true relationship to the public, and in some instances, it must be admitted, with reckless disregard for the future, insisted upon franchise provisions which seemed onerous to the municipalities.

The time has now come for a radical and thorough review of that relationship. In some way, the American people must realize that their interest in the continued efficient operation of these railways is such that it becomes imperative that they should recognize some responsibility for financial results. In some way the credit for the public must be put behind these properties in return for the class of service which it demands.

The Public is Indifferent

In view of the disastrous experiences of electric railways during the war, it is not reasonable that they will be able to attract, in the future, the private capital necessary for their further development. The fact that the public has been willing to permit this great industry to stagger on under the burdens of war, with inadequate relief in the way of increased rates, while exposed to the full brunt of the extraordinary increases in cost of labor and material, raises a question of fundamental equity and fair dealing. The public must be brought to realize that its interest in the electric railways of the country is greater than that of the stockholders or bondholders, and that if the electric railways are to continue to discharge their essential service, the public must, in some way, guarantee an adequate return upon the capital invested.

What is needed then, at this time, is a thorough and impartial study of the whole question of electric railway franchise, with the end in view of establishing the industry on a wholesome, economic basis, which will guarantee continued efficient service to the public. Such a study should be made primarily from the standpoint of the public interest—what is best for the communities served. It is a national problem and not one for the owners of the railways alone, or chiefly.

The solution must provide for adequate service to the public and a proper return upon the invested capital.

Franchise Should Provide Fair Return

The time has come for the electric railway to say to the public that they are willing to co-operate in the working of a standard franchise, which shall provide for a proper return upon the fair value of the property, and guarantee efficient service to the communities. On such a basis the matter of fares readily adjusts itself. On such a basis, the responsibility of electric railways for paving, the annually recurring question of taxation, the undergrounding of trolleys, the extension of service into unproductive territory, and numerous other questions that have caused irritation in the past, present themselves for consideration in an entirely new aspect. The experiences through which we have just passed have impressed upon the public mind the fact that additional and unnecessary burdens imposed upon the electric railways must logically and inevitably be reflected, sooner or later, in the rate of fare, or in the impairment of the service rendered. With this fact established, the question whether the entire cost of the transportation should be borne by the passenger, or whether a certain part should not be absorbed as a community charge, can be fairly considered on its merits. It is in this spirit that we must approach the consideration of this important question.

The Public Means To Be Fair—But They Must Be Told the Facts

Just as I was about to reach for my coat and hat the fellow said that another thing he had intended to speak about was the unfairness of the public. That was such an interesting topic that I again picked up my wrinkled napkin, ordered another cup of black coffee, and waited for him to make some point that I could dispute. But there was no chance for an argument. He is a member of one of America's big public utility organizations—a street car company, in fact. He cited the 2 cent and 4 cent and up advances in the prices of the various little things that we used to pay 5 cents for. He mentioned some of the 4 cent articles that are now 6 cents and the 2 cent things that are now 5 cents; and then he got right down to the cent and mentioned how even the newspapers had increased their prices 100 per cent. It was all fair and just, as he said, but—and here's where he was sparring for a combat—but street car fare is still 5 cents in most cities.

I suppose I'll be accused of plutocratic leanings because I agree with him. But what could I say? There's no chance for an argument so far as I can see. Carfare is only 5 cents, it was 5 cents twenty years ago when street cars didn't carry us one-third as far for 5 cents as they do now—and in New York it will be 5 cents twenty years hence, I believe.

The trouble lies in the fact that public utilities are the tools of politicians. If politics—but why start an argument that never would end?

Unfairness of the public is what the man started to discuss. He says the public condemns the street car company without a hearing. Sure—I know that, as does everybody else. That isn't because of the unfairness of the public, but it's due to the public's blissful ignorance. The public knows nothing about the street car company's troubles because the street car company doesn't make a confidant of the public. How? By advertising. That's the way to get a hearing nowadays.

Public utilities, like some other big interests, rush into print only at the last moment, when some calamity is about to befall them. Then they always have to make a sort of plea for the defense argument, wherein the community is the plaintiff. The public is the community and it stands by its guns. It doesn't realize the good that the defendant has done because it has heard only the bad. Talk to it honestly—tell it the truth—and the public is the fairest animal on earth.—Advertising and Selling.

Storage of Lake Brule

The Quebec Streams Commission have awarded a contract for the construction of a storage dam at Lake Brule, ten miles from Beaufort, P. Q., to the Laurentian Power Company, at a cost of \$50,000. The plan is to construct three dams, a wooden crib dam filled with stone, and two small earth dams. The length of the wooden dams at the crest is to be 225 feet. The structure will provide additional water power for the Hydro-electric plant of the Laurentian Power Co.

The American Telegraph and Telephone Company have announced the invention and development by the technical staff of the Bell system of a practical system of multiplex telephony and telegraphy which will greatly increase the carrying capacity of long distance telephone and telegraph wires. By the new system, four telephone conversations over one pair of wires can be carried on simultaneously, in addition to the conversation carried on ordinarily, making five messages in all. One pair of wires can also be utilized for forty simultaneous telegraph messages.

The Contractor-Dealer

Toronto Electrical Contractor-Dealers Take a Night Off to do Honor to Their President, Mr. Kenneth A. McIntyre—Large and Enthusiastic Representation Present from All Sections of the Trade

The January monthly meeting of the Toronto Section of the Ontario Association of Electrical Contractors and Dealers was held in the King Edward Hotel, on the evening of Tuesday the 7th, and took the form of a complimentary dinner to the president, Mr. Kenneth A. McIntyre. Mr. Harry Hicks, vice-president, occupied the chair.

These meetings are now open to the whole trade and there was a goodly representation of manufacturers, jobbers, central stations, and inspectors, in addition to a practically full attendance of contractor-dealers. The regular business occupied only a few minutes and consisted chiefly of the approval, clause by clause, of the final agreement with the employees, given below. The balance of the entertainment consisted of solos, choruses and brief addresses. Toasts were proposed to "The King," and "Our Guests," the former by Mr. H. H. Couzens, general manager Toronto Hydro, and the latter by the Chairman, responded to by Mr. H. F. Strickland, chief electrical inspector for the Province. A final toast to the "Electrical Contractor-Dealer—a bigger, better and more prosperous merchant in 1919," brought a reply in the form of a good story from Mr. Harry Rooks. In addition to the music (?) supplied by the banquetters themselves, a number of solos by Mr. Hamilton Gardner added very materially to the enjoyment of the evening.

Considerable interest was aroused—and there was much favorable comment too—on the issue of "The Booster," distributed during the proceedings. A sheet of this kind can do much to maintain the interest of the members and especially if all the members lend a hand in its preparation. Some extracts are printed elsewhere. The Exchange Sheet, indicating equipment and supplies for sale or exchange among the members of the association, also gives promise of usefulness.

The crowning event of the evening was, of course, the presentation of an illuminated address to Mr. McIntyre, expressing the appreciation of the association members for the splendid organization work he had done during the past year. The address was read by Mr. Frank T. Groome, and presented by the secretary, Mr. J. Everard Myers, to Mr. McIntyre, who made a characteristically earnest and eloquent reply. The presentation came as a complete surprise to Mr. McIntyre.

Extracts from the Booster

Issued in the interests of the Ontario Electrical Contractors and Dealers.

The war is over, and in our electrical field there are no more war orders, either direct or indirect, and we must again reach out after regular construction, which in due time will spring to life.

Above all, there must not be a break in prices or a general season of price-cutting. If there is, thousands will be

lost and serious trouble ensue. No man, be he ever so versed in conditions to-day, can tell just how things are going to jump. We all, however, can bank on wonderful days ahead in the electrical field for all who have sense enough to keep their heads during the period of shifting gears, so to speak. We must all be fair to our employees and competitors, and they in turn must be fair with us.

The wonderful spirit of co-operation, so splendidly displayed during the war, must continue to grow even more.

The Goodwin plan seemed to suit the Canadian General Electric Co. They joined as Associated Members right away, and we have an application from the Northern Electric. Come and meet our new associates.

Send in list of items that are eating their heads off on your shelves, and we will try and sell them for you. This service is free. Let us sell your dead stock. This sheet will fit your folder, and will be issued monthly if the members make proper use of its service columns. It's up to you!

The Ontario Association of Electrical Contractors and Dealers—Toronto District Working Rules

1. Adopted by the Toronto District of the Ontario Association of Electrical Contractors and Dealers, for the guidance of its members, on January 9th, 1919, in force from January 20th, 1919, and agreed to by Toronto Local 353, I.B.E.W. These rules are to be posted in the shops of the members.

2. Eight hours' labor shall constitute one day's work, except on out-of-town work, which shall be ten hours. All labor over eight hours per day, except as above, shall be paid for at the rate of one and one-half hours' pay for each hour's work until twelve midnight, after which double time until relieved; work performed on Sunday and legal holidays shall be paid for at the rate of double time. Saturday to be a half-holiday; Saturday work between 12.00 noon and 5.00 p.m. to be paid for at the rate of time and one-half, and double time thereafter until relieved.

All men shall be on the job, ready to commence work, at the regular hours for starting work, which shall be between 8.00 a.m. and 5.00 p.m. When workmen are required to report at the shop, they shall report not later than 7.50 a.m., and shall be ready to receive orders or supplies. Failure to comply with this shall result in a reduction in pay for the time lost, and, if the men are instructed to report at the shop for work and are not sent on a job, they shall be paid for two hours' time.

On shift work night men shall be paid nine hours' for eight hours' work. This arrangement to apply only when two or more shifts per day are used. Shifts to be changed in rotation weekly. Overtime of night shifts for work over eight hours to be based on regular hourly rate.

3. The holidays shall be all legal and statutory holidays.

4. The help employed shall be divided into two classes: Journeymen and Apprentices.

Apprentices shall be sub-divided into four classes, described as: First, Second, Third and Fourth year, according to time served and qualifications as determined each year upon examination.

Throughout the four years' apprenticeship is to be required, as part of the above qualifications, a successful standing in a supplementary electrical course in the Toronto Technical Schools. This course is to be planned by a Special Educational Committee of three members, one from each organization and one from the staff of the Toronto Technical Schools.

The first half-year of the apprentice's time shall be probationary. At the end of this probationary period, he shall be entitled to membership in Toronto Local 353, I.B.E.W., and to a rate of \$8.00 per week.

Second year, 1st half, \$9.00 per week; 2nd half, \$10.00 per week. Third year, 1st half, \$11.00 per week; 2nd half, \$12.00 per week. Fourth year, 1st half, 35 cents per hour; 2nd half, 40 cents per hour.

After at least three years' continuous service with the one employer and attaining successful standing at the end of the third year, the fourth-year apprentice shall be loaned by the employer a kit of tools as listed below.

After at least four years' continuous service with the one employer, and being successful in obtaining his Journeyman's card, the employer shall present to the employee the kit of tools which was loaned to him. Lay-off periods shall not be considered as interrupting the continuity of service.

List of tools to be comprised as follows:

..... (fill in)

The apprentice, when required, shall go to the shop after 5.00 o'clock to get material so as to be on job with same the following morning at 8.00 a.m., without loss of Journeyman's time. Apprentice shall not be paid for such time.

A fourth-year apprentice shall be permitted to work as a journeyman. Not more than one fourth-year apprentice to every four journeymen in the one shop to be permitted to work under above conditions.

One apprentice to be allowed to each journeyman or fourth-year apprentice.

Apprentices now in the trade are to be classified as soon as possible by the Joint Examining Board as above, upon determination of their length of service and qualifications.

Disabled soldiers, after successful completion of the six months' course in "General Principles of Electricity and Electric Wiring," under the Department of Soldiers' Civil Re-establishment and the Soldiers' Aid Commission, shall be entitled to classification as fourth-year apprentices.

Disabled soldiers with previous electrical experience, who are similarly granted training courses in the industry by the above Commissions shall, at the end of the training period (which shall include supplementary electrical course at the Technical Schools), be examined by the Joint Examining Board and, if successful, shall be entitled to classification as fourth-year apprentices.

Physically fit, honorably-discharged soldiers with previous electrical experience, applying direct for employment, shall be granted same conditions as those in the preceding paragraph. Minimum wage to be \$12.00 per week.

5. The standard rate of journeymen's wages shall be 67½ c. per hour.

Should the Toronto District of the Ontario Association of Electrical Contractors and Dealers receive complaints from two or more members concerning alleged incompetence of a journeyman, or alleging cause for his re-examination and re-classification, or for forfeiture of his membership in Toronto Local 353, I.B.E.W., the matter shall be referred to the Conference Board, with complete information. The Conference Board shall have authority to direct the re-examination of said journeyman by the Examining Board, and the decision of the Examining Board shall be final and binding on all parties. If the Conference Board recom-

mends forfeiture of the journeyman's membership, in Toronto Local 353, I.B.E.W., the recommendation, with full information, shall be passed on to Toronto Local 353, I.B.E.W., for final action.

6. All carfare, other than that to reach the job or shop within city limits and return to employee's residence, shall be paid by the employer, either in cash or car tickets, at his option. All workmen working on jobs beyond the present city limits shall take car going to or returning from work, which arrives at the present city limits as near 8 a.m. or 5 p.m. as car schedule will permit.

7. The Toronto District of the Ontario Association of Electrical Contractors and Dealers shall appoint two members to act with two members of Local 353, I.B.E.W., as a Joint Examining Board.

8. No employer of labor for the installation of electrical work shall be given any better term of conditions regarding hours of labor, wages per hour, etc.

9. Employers, in case of work outside of Toronto, shall pay suburban car, railroad, or boat fare, and all expenses for room and board.

10. There shall be a Conference Board, consisting of three members of Local 353, I.B.E.W., and three members of the Toronto District of the Ontario Association of Electrical Contractors and Dealers. This Conference Board shall meet at least once each month, or at call of their chairman. All complaints by employer or employee, or covering labor conditions, must be submitted to the Board in writing. The Conference Board shall also work out and put into effect rules governing extra compensation to foremen. Rules and Regulations to govern the Board's transactions shall be made by the members thereof.

11. Any journeyman, who shall do any work in violation of the Electrical Inspection Department's Rules, or in such manner so that it will not pass inspection, shall do said work properly in his own time and expense, or pay for same being done. (It being understood that, if such work is done by order of the contractor, the contractor assumes all responsibility as to it being passed by the Electrical Inspection Department, and expense for making work right). In the event of a journeyman refusing to comply with this provision, the matter shall be referred to the Conference Board for investigation and, if the journeyman be found responsible, the Local shall compel him to comply with said provision.

Note.

Mr. Thomas Crawford will be at the Labor Temple each day from 12 to 1 noon. Phone Main 1899 for men.

When hiring men always refer to the last employer.

A Good Motto for 1919

Owing to the unprecedented conditions with which we are at present surrounded, which make it impossible for the wisest to predict what may happen in the next six months, it is more than ever necessary that contractor-dealers, one and all, put their shoulders to the wheels of their organization and push with might and main. A good motto for 1919 may well be—Forget you have a president; forget you have an executive committee; let every member work and act as if the responsibility of the success of the association rested on his own shoulders.

B. C. Contractors Hold a Very Successful Get-Together Supper and Concert—Secretary Capt. Conway has Needless Qualms

A few days ago we wrote Capt. W. J. Conway, secretary of the B. C. Association of Electrical Contractors and Dealers, for a report of their recent get-together supper and concert. Our idea had been to give the usual cut and dried report, but Capt. Conway's reply was so much of an improvement on the usual method of dealing with a function of this kind, so full of "pep" and information of interest to the trade in general, that we crave his pardon for reproducing the letter as it reached us. Evidently the electrical contractors in the coast province are keeping up their enthusiasm in their organization, getting thoroughly acquainted with one another, and improving the status of the contractor-dealer's business. The electrical men in the East wish in a short time to see their way to organize strong associations, so that in the end, we may have the electrical contractor-dealers of Canada working together in one unified, harmonious organization. Capt. Conway's letter follows:

Editor Electrical News:

In reply to yours of the 9th instant, re the "Get-together" Supper and Concert recently held by this association, I regret that a report of the addresses was not taken, but trust that you may be able to obtain a few notes from the following description of the evening we had.

To begin with, the event was, to me, an astonishing success. When arranging for the supper, I was, frankly, scared when the caterer asked me to guarantee at least 75 at the supper. Seventy-five, man alive, where do you expect us to get that number; why there are only about 20 contractors and dealers in the city, half of them are sick of the flu, or are getting over it, whilst the remainder are very busy preparing for the Christmas shopping.

The guarantee was given, and I went about in fear during the interval, though the president of the association, Mr. E. Brettell, assured me that we would have a full house. By the way, the whole of the credit for the success of the affair is due to him; he kindly offered to see to everything himself, knowing that I was very busy on other work for the association.

As the evening approached my fear deepened, I could not

see that seventy-five men would turn out on a wet night, and that after a hard day's work. To me, supper at home, slippers and a comfortable seat by the fire, seemed a great rival attraction. Just before the hour fixed for the supper, I was at my worst, my feet were positively cold, though we had to open a few of the windows in the supper room. The sight of those seventy-five empty chairs that went to make up the guarantee gave me something that must be like shell shock.

We had just fixed up everything, where the various speakers were to sit, etc., when the guests began to arrive. Inside of ten minutes we had to arrange for a couple of extra tables—all those gaping chairs were filled, and I was getting anxious as to where we would put the arriving hungry ones. I was astonished and grateful, especially to the electrical men of the B. C. E. Ry. Co., the Western Power Co., the C. G. E., the Westinghouse Co., the Northern Electric Co., etc. The power companies and the wholesalers turned out in full force, as did, of course, our own boys.

As to the evening we had. The supper was fine, and was disposed of in great style, notwithstanding the handicap we labored under, of trying to keep our eyes on our plates and on the pretty waitresses at the same time.

The speeches were all right; just what we wanted; first a talk from Mr. Neill, manager of the Employers' Association, telling us how to play the game, that is, how to be loyal to each other and to our association ethics, etc. He made a great point in advising us to "Stay Together" now that we had got together. This was followed by an excellent address from the credit manager of the Northern Electric, Mr. F. B. Milligan, on accounting; this was full of good advice and pointers on how to keep your books right, and your credit at high mark. Of course he did not forget to give us the advice we all expected from him, that of "be sure to take your discounts." Mr. George Kidd, general manager of the B. C. Electric Railway Co., Ltd., favored us with an all too brief, bright and optimistic estimate of the coming times, with their great after-the-war problems.

The concert part of the meeting was quite up to the high standard set by the speakers. Miss Adair, of the Northern Electric Co., and Messrs. Dingman and Pacey, of the B. C. E. Ry. Co., with Mr. F. Taggart, were in great singing form, and evidently enjoyed their work quite as much as we did, and that was quite a lot. Mr. Brummitt ably assisted at the

Mr. E. Brettell, President B. C. Ass'n. Electrical Contractors & Dealers

Mr. F. B. Milligan, whose address on "Accounting" is printed on the following page

Captain W. J. Conway, Secretary B. C. Ass'n. Electrical Contractors & Dealers

piano, going far to ensure the success that was attended in the "Everyone Present" choruses.

This chorus singing was an innovation; type sheets, containing choruses of all the popular songs, were given out with the programmes, and at intervals during the evening, "Everyone Present" was asked to join in singing these choruses. They did join, and lustily, enjoying themselves greatly in the process. The introduction of this chorus singing can be strongly recommended for such gatherings; in these "dry" days, this hearty singing by all goes far to fill the gap.

The singing of the Maple Leaf, and God Save the King, by "Everyone Present," brought the affair to an end, leaving us with the feeling that we were a fine lot of fellows, that we had had a great time together, and that we had got to know each other a bit better at our "Get-Together."

Yours very sincerely,

W. J. Conway, Secretary.

Accurate Accounting Necessary to Success—An Address Delivered by Mr. F. B. Milligan, of the Northern Electric Co., Ltd., Before the Vancouver Citizens' Club on December 12th

The control of one's own business is an absolute necessity in these days of competition. I do not think any man can get out all there is in a business for him, unless he can obtain an accurate financial history of it periodically. When I say all he can get out of it, I do not mean immediate tangible profit, but knowledge and business education necessary to keep abreast of the times, which, of course, means tangible benefit some time. The financing of small and moderate sized business is probably the cause of more real worry in the commercial world than any other phase of business. There appear to be two prime causes for these financial troubles—namely:

1. Lack of sufficient capital.
2. Lack of proper management of such financial resources as are already invested.

Without proper books of account it might be possible to find the trouble, but certainly it would be impossible to prescribe a permanent remedy. I do not wish to suggest that lack of sufficient capital can be remedied by any bookkeeping system. I do say, however, that the results of proper accounting will show you definitely whether or not it is possible to go on without additional funds. If it is hopeless the figures should tell you so, and far better know it at once than later. As you know, lack of capital results in weak purchasing power, loss of credit and loss of discounts. Any one of these is sufficient to cause serious trouble and all three together generally mean ruin.

A complete accounting system has been published with the approval of the National Association of Electrical Contractors and Dealers. This not only advises you how to instal the system, but gives cuts of charts and standard forms. It also goes into detail explaining the use of each form and why it is necessary, and especially dwells on overhead accounts, giving eighteen general headings and showing in detail just what each heading covers. It further explains the closing of the books each month, and how to make up the Trial Balance, and how to close the books for the year. This system has been made after considering and adopting the following six cardinal principles:

1. All forms should be standardized.
2. All sales, whether contract, jobbing, day work, or retail, should be costed.
3. A merchandise account should be created through debit entries for purchases and credit entries at cost for materials sold in any way.

4. A general ledger containing all controlling accounts should be made a part of the system.

5. All liabilities should be vouchered each month irrespective of receipt of goods or corrections of invoice. Provision should be made for recharging vendors for any errors or discrepancies in bills.

6. Cash book should combine bank records, both receipts and payments, that is, debit entries equalizing bank deposits for the month and credit entries equalizing charges to bank balance. The cash book should not be used for distribution.

Theoretically, business men correct their overhead percentage at the end of the fiscal year. In practice very few actually do it. Even when the overhead percentage obtained will be an accurate measure of the overhead that should be charged into sales during the next year. It may be an accurate measure and it may not. It may protect the business at the beginning of the year, but it may cease to do this and become a source of danger to profits, if later there is a heavy increase in costs which is not offset by an equal increase in selling prices. I would advise that you see that it is done at once as it is most essential. Granted that the overhead percentage for 1917 was correct, which you should have used for 1918, do you think it advisable to use this percentage for 1919? Certainly not. You should analyze your business at the end of this year, so that you can determine exactly what your overhead should be for 1919.

Nobody knows what the absolute overhead percentage is in electrical business for the country as a whole. That cannot be known until a uniform accounting system has been established on a national scale and has supplied cost figures covering a long period. At present an overhead percentage taken out of any one of several concerns and applied to a group of dealers or contractors can be only an approximate percentage. Yet for all practical purposes it may be a safe percentage for that group. And it would be a dangerous percentage when applied to remote sections of the country, without allowing for the cost variations for that section. It also becomes a dangerous percentage when it is applied over a period of years without annual verification or correction, or when it is applied to a business without an actual test.

Below, I give, in detail, the cost of doing business during 1917 of a Northwest Contractor and Dealer. His cost percentage (based on total sales) covers both contracting and retailing:

		Per cent.
Salaries and wages	\$3,922.10	14.4
Rent and heat	480.19	1.8
Light and power	209.03	.8
Upkeep and repairs		.0
Depreciation	111.24	.4
Insurance	137.51	.5
Taxes	107.20	.4
Interest	391.30	1.5
Telephone, telegraph and postage ...	188.91	.7
Printing and stationery	129.10	.5
Advertising	321.52	1.2
Supplies	131.39	.5
Hauling and delivery	662.59	2.5
Travelling expenses	156.35	.6
Bad debts	272.62	1.0
Association membership	89.25	.3
Gratuities	17.00	.6
Miscellaneous		.0
		—M
Total costs	\$7,327.30	27.7
Total sales, \$26,785.01.		

This appears on the face to be considerably higher than the overhead of an average business, but as it is taken from

actual conditions, it would appear that he is justified in using this figure. However, as I stated before, you should be sure that the figure you intend to use for 1919 is accurate, as you will have to take into consideration that we will shortly have peace, and consequently, a reconstruction period which may change this considerably.

Overhead Costs on Jobs Varying from \$200 to \$200,000 Varies Between 52 and 8 per cent.—What is Yours?

In our last issue we printed a brief reference to the work of the Electrical Estimators' Association, of Chicago, in connection with the preparation of figure showing the cost of overhead on jobs of various sizes. The results of the investigations of this association were recently presented by Mr. E. L. Morley, of the L. K. Comstock Co., at a conference of estimators and contractors in Chicago. We print below extracts from this report, and also a curve showing the overhead percentages on jobs varying from \$1,000 to \$15,000, taken from Electrical Merchandising. In this curve the overhead is expressed as a percentage of the cost of installation and not of the volume of sales. The extension of the curve beyond \$15,000 gives the following percentages: \$20,000, 13 per cent.; \$30,000, 11.5 per cent.; \$40,000, 10.75 per cent.; \$50,000, 10.5 per cent.; \$60,000, 10 per cent.; \$100,000, 9 per cent.; \$160,000 and up, 8.5 per cent. In the curve, a \$200 job runs 52 per cent.; a \$300 job, 42 per cent.; a \$1,000 36 per cent.; and so on. The extracts follow:

The first question to present itself to your committee was: What is "overhead"? Several descriptions were given. One described it as the ratio of the annual cost of doing business to the total volume of sales; another, the ratio of the annual cost of doing business to the volume of sales less the profit; and still another, the ratio of the annual cost of doing business to the cost of labor and material installed during the year.

Working with any of these descriptions gives only average percentage and therefore not the correct percentage of overhead to be added to the estimated cost of any particular installation, and that's the thing we're after.

In all discussions of overhead, either written or oral, with which I am familiar, the statement is made that overhead determined in accordance with one of the foregoing descriptions for any year cannot always be safely applied for the next year, as the volume of business may change and other conditions vary. This is at once an admission that the overhead percentage so determined is of little value.

You also hear it stated that the overhead of contractors doing a large volume of business is less than that of a small contractor. This is true, but not the whole truth. Any large contractor who thinks his overhead on a small job is less than the small contractor's is fooling himself. The real reason for the large volume of business being carried on with a lower overhead is due to other causes than the volume. I will endeavor to make this clear later.

The committee finally decided to accept the cost of installation as the base for expressing overhead.

Decided What the Curve Should Represent.

A suggestion had been adopted that a curve of overhead percentages be plotted and it became necessary to decide what this curve should represent. The original suggestion was to plot percentages in relation to the annual volume of business. This was at variance with the decision to use cost of installation as the base for expressing overhead. The point was also raised that a curve using instal-

lation cost would give only average results and therefore would not give the proper percentage to be applied to any particular estimate as installations of different costs carried entirely different percentages of overhead. This immediately started something and actual experiences were given showing that this point was well taken.

An example is as follows: The John Jones Company calls up for an estimate on alterations and additions to wiring in its building. An estimator is sent and requires an hour or more to reach the location, waits fifteen minutes or so to see the proper party, spends an hour going over work, returns to office, makes up installation cost as approximately \$1,000. Estimator's time one day. What overhead should be added—the average? A contractor doing so and closing the contract will be losing money on that particular job unless the average estimated cost of installation of his jobs is \$1,000 or less.

How many \$500 and \$1,000 jobs does a contractor figure on and how many of these does he close? A ratio of 10 per cent. is probably high. The overhead for any particular

Curve showing overhead for jobs \$200 to \$15,000

cost estimate must include as nearly as possible the expense of estimating similar work which was not closed.

Let us follow this job after it is closed by a contractor who has added 20 per cent. to his labor and material cost for overhead and 15 per cent. to this net cost for profit; result, \$1,380, a total of 38 per cent. above estimated cost. The contractor has been fortunate, only estimating nine other similar jobs not closed. Each has had an estimating cost averaging not less than \$10, probably more. Fifty per cent. of the overhead is gone and the job only closed. Overhead has been working unobserved. It now gets busy in the open. Its first demand is a job ticket and this costs at least as much for a \$1,400 job as for a \$10,000 one, and probably more as there are no plans and specifications and the ticket must give an accurate description of the work. The mechanic is then made familiar with the work by either coming to the office or meeting the estimator or superintendent at the job.

The material list is made up and orders sent out. The time and material cost for these items is much greater in proportion for the \$1,400 job than for the \$10,000 one. And so on along the line for superintending, bookkeeping, and all other items entering into overhead expense. When the work is completed, the overhead has been nearer 40 per cent. than 20 per cent. and all or part of the expected profit goes to overhead. The contractor does not know this as he has not separated his overhead for this particular job. At the end of the year, however, he realizes that his profits are not as great as he expected from what he considered liberal percentages added for overhead and profit on his smaller work.

After several stories similar to the foregoing and many

discussions, a curve was developed by using a few points obtained from actual data given by members of the committee. From this curve I will endeavor to explain why these results are more nearly correct than the average percentages usually obtained.

The curve is drawn in two parts. The more important part is drawn with the large divisions representing \$1,000, while in the other portion they show as \$10,000.

Always bear in mind that the dollars cost shown represent the estimate sheet cost and that the overhead percentage is applied directly to this cost.

By estimate sheet cost, or installation cost, is not meant simply the estimated cost of labor and material, but also includes all items directly chargeable to the job, such as bond, if any, liability insurance, drawings, inspection, freight, railroad fares, board, etc.

The curve starts at \$200 with 52 per cent., falls rapidly to 42 per cent. at \$500, 36 per cent. at \$1,000, 29 per cent. at \$2,000, 25 per cent. at \$3,000 and is now falling more gradually to 21 per cent. at \$5,000, 16.2 per cent. at \$10,000, and 14.25 per cent. at \$15,000. In the other curve we find a still more gradual decline to 13 per cent. at \$20,000, 10 per cent. at \$60,000, 9 per cent. at \$100,000, finally reaching 8.5 per cent. at \$160,000, and thereafter the curve is practically horizontal at 8.5 per cent.

The small contractor doing an annual business of \$20,000 to \$40,000 will find his job costs falling on the curve from \$200 to \$5,000, with the larger proportion near \$1,000 or less. From \$50,000 to \$100,000 the job costs will fall around \$2,000 to \$5,000. The large contractor doing \$250,000 to \$500,000 will find his jobs on the flatter portion of the curve from \$10,000 up.

From this it appears that the lower overhead of the larger contractor is due not to the fact that the volume of business is greater, but to the lower percentage of overhead which the larger contracts carry.

Irrespective of the yearly volume of business, each estimated job should be apportioned its proper overhead percentage, as determined by its size, instead of an average per-

centage obtained from the annual cost of conducting the business and the volume of business.

In using a curve of this character it is easy to check at the end of the year whether the overhead percentages are correct or not, by tabulating the cost of all jobs and applying to each the proper percentage of overhead according to its size. The total should approximate the amount the books show as the cost of running the business.

Let us now turn to the application of the curve where the volume of business increases or decreases. If the volume decreases materially it is usually due to fewer of the large jobs and a portion of this may even be offset by more small ones. As the small jobs carry the larger overhead, it is readily seen that the overhead tends automatically to adjust itself where an average percentage would not. This also applies to an increase in volume. The increase being usually due to more of the larger jobs.

With this system of applying overhead it is evident that the large contractor bidding on the small work in competition with the small contractors should use practically the same percentages and in so doing, if he obtains the work, not rob the larger jobs of profit to pay overhead on the small ones.

This system, we believe, will put estimating on a firmer foundation, stabilize quotations and improve the condition of the electrical contractors in general, which is the aim of all associations connected with the electrical industry.

Canadian General Electric Company Open Handsome New Supply Warehouse

The Canadian General Electric Co. have recently completed and opened their new supply warehouse on King Street West, just adjoining the head office building, at the corner of King and Simcoe Streets. This building is of mill construction, six storeys and basement, measuring 48 ft. x 185 ft. The main entrance is on King Street through a spacious vestibule, flanked by large show windows, illustrated in one of the cuts herewith. Immediately inside is the main department. The front portions of the second and

View of entrance to C.G.E. supply warehouse—Large display window on each side

View of section of general sales room

View of section of general sales room

third floors are occupied as offices; the rear portions of the ground, first and second floors, for packing, shipping and storage purposes. The three upper flats are being used exclusively for storage. A view of one of the upper floors is shown in one of the illustrations, which indicates, in a general way, the plan of the three upper storeys, that is, on the right hand, tiers of storage shelves, and on the left

chute, operating from each floor to the ground floor, on which goods are placed as soon as they are prepared for shipment. There is also an automatic dumb waiter and an electric freight elevator, in addition to the passenger elevator.

Two of the views show the main sales and demonstration room on the ground floor. The company do not encourage retail sales, preferring rather to maintain this room for the use of contractor-dealers and jobbers, and for pure demonstration purposes.

A feature of the new building is the arrangement and organization which will make it possible to give an exceedingly prompt service. For example, a contractor-dealer approaches the counter and asks for a certain article. The request is promptly telephoned to the individual section where this article is stocked. The article is placed on the dumb waiter and delivered to the ground floor, where an attendant, always in waiting, places it upon the counter. Orders received by mail or telephone receive the same treatment. It is the ambition of the management to give a service comparable with that of the best retail department stores, and under the efficient supervision of Mr. L. O. Horner, who is in charge of the supply sales department, there is every evidence that this ambition will become a fact.

The basement is given over to the storage of heavier material, such as piping, large coils of wire, etc.

The Harvey Hubbell Co. of Canada, Limited, Mr. E. G. Mack, Managing Director, have just issued a new catalogue, No. 16. The complete line of Hubbell products is now manufactured in Canada, and Hubbell products may be obtained from coast to coast through any reputable supply house, or direct from the company. A copy of the catalogue may be had on request to the company at Toronto.

The Canadian Crocker-Wheeler Company, Limited, St. Catharines, Ont., have issued Bulletin No. 1000, illustrating oil switches, induction motors and transformers.

The Canada Wire & Cable Co., Limited, Toronto, will exhibit at the Lyons, France, fair, to be held in March next.

View of stock room, showing compact arrangement

hand, reserve stock ready to place on the shelves as the supply needs replenishing. Each floor is divided into sections, generally four, each in charge of one man, and when information is required as to whether any particular line is in stock, the particular man in charge of this section is immediately communicated with. This avoids the possibility of accepting an order for goods not in stock and also guarantees prompt shipment.

The building is equipped with a steel spiral goods

Northern Electric Company Placing on Market a Large Range of Farmers' Light and Power Plants

Feeding the world is a big job but this is really the job that the Canadian and the U. S. farmer now have before them. It is big business and profitable business, but if the farmer to-day is a business man, and farming is his business, then surely he must use business methods and employ the most efficient means available.

Electricity spells efficiency for the farmer just as surely

as it does to the manufacturer or other producer in the city. When the many electric power lines first began extending into the rural districts most farmers thought that they would soon be able to have the current on their own farms, but when we realize the tremendous number of farmers and their distribution over such an enormous territory, it becomes evident that the majority of farmers must always depend upon a private electric service.

This situation is practically the same as the telephone business; the larger companies have been able to develop the important centers, but for the neighborhood lines thousands of local companies have been formed.

A new power and light generator for the farmer is now being placed on the market by the Northern Electric Company. The company offers two types of equipment, first, that for use with the farmer's own engine, commonly known as belted type, and the Consolidated or direct connected types, which combine in a single unit the electric generator, switch-board and engine. Both of these systems use storage battery for all light load service. The belted type has the particular advantage for the farmer in that he can use a gasoline engine for running the milking machine or pumping water for the stock, and at the same time operate the dynamo to produce electricity which can be used for charging the storage batteries, then in the evening or other time when the engine is not running the electricity is available. Figure 1 shows this belted equipment with the storage batteries mounted on a very convenient stand.

Many farmers and others have no power requirements and prefer an equipment which will require a minimum of attention and occupy a small floor space. The Consolidated type equipment of the company is furnished both in the semi-automatic and full automatic types. The semi-automatic type starts whenever a button on the plant is pressed, but stops automatically when the batteries become charged. So long as these private plants were largely used for lighting this arrangement was all that could be desired, but during the past few years the exceptional demand for power has made it necessary that the plant should also start automatically. Fig-

ure 2 shows a one kw. full automatic plant which has the following features: the plant will start automatically whenever the storage batteries are 15 per cent. discharged, thus leaving always in reserve 85 per cent. of the storage battery; will start automatically at any time whenever a power device is connected to the circuit or whenever load exceeds 350 watts; will stop automatically when the batteries are filled. This machine takes full advantage of the storage battery for all ordinary loads, but does not demand that the storage battery be used for power work. Such an arrangement gives a machine the highest efficiency possible. For all power work

Fig. 1—Belted type can be used with farmer's own engine—Storage battery mounted on stand.

Fig. 2—Automatic 1/3 kw. "home" size

ence. Such a large fuel supply combined with an automatic plant enables the user to get electric service for power or light without having to be continually filling the tank or worrying whether his storage batteries are charged or not.

An automatic plant of 1-3 k.w. is also furnished, see Fig. 2, and while this will pump 120 gallons of water an hour, or run the washing machine, churn or cream separator, it is not intended for heavy duty power equipment. It is a home size,

automatic, storage battery plant, and is an ideal equipment for use in summer homes, town residences and all of the places where 15 to 20 twenty-watt lamps will provide sufficient lighting.

The company also supplies regularly 2, 5, 10 and 15 kw. plants full automatic. The 5 kw. is particularly adaptable for small town lighting. As the operation is automatic the owner can afford to have an installation and sell current on the measured basis, whereas with the manual system which requires his constant attention there would not be sufficient earnings made to warrant the time he would have to spend.

The 2 kw., as regularly furnished, is 32 volt or 110 volt. All plants under 2 kw. are 32 volts and all over are 110 volts.

Fig. 3—1 kw. full automatic plant

This range of plants, from 1-3 to 15 k.w., is the most complete upon the market and offers the electrical contractor a most valuable addition to his lines. He will have a plant for every prospect, and once he has started the sale he will not be obliged to give up the job on account of having too small a plant, or actually take the job and then furnish a plant entirely inadequate for their requirements.

We understand it is the company's intention to sell this equipment through the electrical trade as far as possible. Electrical dealers should be quick to see the advantage of doubling their prospects. Census reports show that half of the population of the country live on the farm. This practi-

Fig. 4—5 kw. automatic equipment

cally undeveloped trade should go to the electrical dealer. He is the logical man to sell such lines and as his business as an electrical dealer is now established, and he can handle the installation better than anyone else, he should get this business.

Air Compressors; Steam Stop Valves, Check Valves, Water valves and Accessories.—Two very complete catalogues, issued by Alley & MacLennan, engineers, Glasgow. These catalogues are well illustrated, bound with stiff covers, and contain a quantity of useful information on the subjects of which they treat.

WANTED

A real live Electrical Contractor-Dealer in each of the Provinces of Alberta, Saskatchewan and Manitoba, to get in touch with the B. C. Association of Electrical Contractors and Dealers with a view to forming kindred associations in these provinces. Address the Secretary, 406 Yorkshire Building, Vancouver, B.C.

A by-law authorizing the purchase of the electric lighting plant owned and operated by Mr. Walter Gould, Uxbridge, Ont., has been passed.

Current News and Notes

Antigonish, N.S.

The municipal electric light plant at Antigonish, N.S., was recently destroyed by fire. It will be rebuilt immediately and it is likely that two new generators will be required.

Bloomfield, Ont.

Arrangements have been made for the construction of a distributing system at Bloomfield, Ont. The citizens agreed to dig all the holes necessary, free of cost, and the Hydro-electric Commission will complete the rest of the work, employing local labor.

Brantford, Ont.

A by-law authorizing the expenditure of \$125,000 for extensions to the Brantford street railway, was passed by the ratepayers on January 1.

Carleton Place, Ont.

The ratepayers voted on January 1 on a Hydro enabling by-law to provide for the purchase of the local plant owned by H. Brown & Sons for the sum of \$100,000.

Cobalt, Ont.

M. J. O'Brien, of Renfrew, Ont., is said to be interested in a water-power development at Des Quinze, about twenty-five miles northeast of Cobalt. This site is centrally situated in a good mineral and pulpwood zone and is said to be capable of yielding 250,000 horse-power.

Hamilton, Ont.

It has been suggested that the Hydro-electric Power Commission take over the Hamilton Radial Railway line running from Hamilton to Oakville and operate it as a link in the proposed system of Hydro railways. The company sus-

pended operations beyond Burlington Beach on December 13 owing to the refusal of the municipalities interested to grant an increase in fares.

London, Ont.

The fare on the London and Port Stanley Railway, between London and Port Stanley, has been increased from thirty cents to fifty cents return, effective from the 24th of May to the 10th of September. Children will be carried for half fare.

Niagara Falls, Ont.

The ratepayers of Niagara Falls, Ont., have passed a by-law authorizing the purchase of the local street railway, which is operated by a private company. The franchise expires in March, 1920.

Regina, Sask.

At the coming session of the Saskatchewan legislature an amendment to the Railway Act, permitting the use of one-man cars, will come up for discussion.

While the number of passengers carried by the Regina municipal street railway during the year 1918 was 200,000 less than in 1917, the revenue was \$15,500 over that of the previous year. This was due to an increase to the straight five-cent fare early in the year. The total passenger receipts amounted to \$230,582.

Vancouver, B.C.

The Vancouver city council have drawn up an agreement providing that the pay of electrical workers, from January 1 to December 31, 1919, shall be as follows: Foremen, \$175; linemen, \$150; operators, \$135.

Commencing on January 1 the British Columbia Electric Railway Company put into effect a 25 per cent. reduction in domestic lighting rates. The charge is now 6 cents per kw.h.

You Could Stand on a Wet Floor and Operate the Switches of a Krantz Safety Panel Board

with absolutely no danger of shock because all current is shut off from the switch handle compartment.

When necessary to renew fuses or to replace a damaged switch it can be done from the front, and therefore, without disturbing wire connections.

KRANTZ SAFETY PANEL BOARDS are thorough in operation. 100 per cent. safe, and by their attractive appearance, are a handsome addition to any room.

Essential to all buildings equipped with electric power.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

Can We Sell Electrical Goods in France?

Electricity as a great labor-saving source, will have much to do with the reconstruction of France and Belgium, and it would seem that American manufacturers will be called upon for many electrical devices. An engineer who has made a close study of the French market for 25 years, believes that material if not radical, changes in their products must be made by American exporters who expect to dispose of their goods in France, where the methods of installation and the standards of quality are old-fashioned, to say the least.

"American methods and materials make the cost per outlet prohibitively high," said a French importer, "and that is the principal obstacle to the sale of American electrical supplies. Because

carelessness is not a national trait with us, the fire losses due to electrical installations in France are not one-tenth as great as the losses from similar causes in the United States, in spite of our crude devices, so we naturally think that such devices are good enough. If Americans will make simpler and less perfect appliances which will be cheaper to produce, thereby lowering the selling price, the French market offers good prospects. The cost is the chief factor." Scientific American.

Inspectors Welcome the Walger Connector

Solderless Connection

Insulating Shell and Cap

Patented Canada 1917.
Patent Pending U. S.

DISCARD THAT BLOW TORCH

INSPECTION.—You will find that the Inspector will welcome the Walger Connector. He has no sticky tape to unwrap before he gets to the joint—just merely unscrews the bushing cap with thumb and finger and the connection is in full view. No dirty hands for either the Electrician or the Inspector. Walger Connectors are Simple, Safe, and Secure. They save money and time.

Approved by The Underwriters' Laboratories, Chicago, for No. 12 wire and under.

Approved by the Hydro-Electric Power Commission of Ontario.

Write your Jobber for prices or write us.

Sales

Agent—C. JACKSON, 22 College Street, TORONTO, ONT.

The EDEN Electric Washer

Good Profits—Easy Sales

are assured for the dealer who handles the Eden Washing Machine. A first grade machine, that once sold, stays sold and brings new customers.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL

The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"

Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"

Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"

Fire-resisting paint, or colorless solution.

"ARMACELL"

Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"

Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"

for coloring electric lamps. Used in the Royal Navy. Weather-proof. Dries rapidly.

"ARMABRON"

Bitumen protective paint, elastic, acid-resisting, weatherproof.

Renewable Fuses

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

SQUARE D

SWITCHES

**As Long as One
Open Knife Switch
Remains, Your
Plant is Unsafe**

If there are *any* open knife switches in your plant an accident is likely to happen.

And *one* accident may cost more than a complete installation of Square D Switches which would have prevented it.

Square D Switches do more than eliminate accidents and liability.

The care-free operation permits operators to give undivided attention to their work, which promotes production. The quick action protects equipment.

Concluding a year of Achievement

America's splendid industrial achievements in the memorable year of 1918 were possible through the sound judgment displayed in so systematizing production as to conserve needed materials and to effect economies in operating and maintenance

ECONOMY Renewable FUSES

have played a noteworthy part by protecting vitally important electrical circuits of the U. S. Navy, the leading steel and powder mills and thousands of representative plants in all branches of industry against the fire and accident hazards of overloads and short circuits. It was due, in part, to their accurate rating and all-round efficiency that the wheels were kept turning with safety.

They have directly saved millions of dollars for their thousands of users because they cut annual fuse maintenance costs 80 per cent. as compared with the use of "One-Time" fuses.

We now face the great reconstruction period. Conservation and economy must be practiced more extensively and constructively than ever before. Economy Fuses are essentials as factors of practical economy and conservation.

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating informa-
tion no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

THE BRADSTREET COMPANY

B.C.; Winnipeg, Man.; Calgary, Alta.; Ed-
monton, Alta.

THOS. C. IRVING,
Gen. Man. Western Canada, Toronto.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

National ELECTRIC

Reconstruction Period

The past four years have been strenuous and trying ones for everyone.

Scarcity of raw material and labor and the fact that most of our Plant was utilized for War work, seriously handicapped our SERVICE to our Customers.

With it all we have done a bigger business each year and therefore must have given fairly good SERVICE under these circumstances.

Now For 1919

We have a bigger Plant, bigger Stock, bigger Line and better Equipment.

Our Service Policy will be SHIP FROM STOCK.

As for our Appliances, they have an AA1 Rating

Generation, Transmission and Application of Electricity

The Advent of the New Means Passing of the Old

In the course of our development, constant change in methods and equipment is necessary. This holds true of our Trade Mark. Necessity demands a new design. Therefore, we have adopted the oval design and discarded the original circle, necessitated by similarity of several other concerns' designs. We have also adopted the slogan in connection with our trade mark, "Electricity's Safety Valve." This is a fitting description of Buss Fuses.

The Buss Oval Trade Mark is the Symbol of Fuse Quality

The new trade mark will symbolize the same quality of materials, accuracy of action and perfection of protection that has made Buss Fuses the premier equipment in the electrical field.

Be sure to remember the new Oval Trade Mark that identifies Buss Fuses.

Buss Fuses are furnished in renewable and non-renewable types.

Best Known Cable

Reel In Canada

THE demand for Northern Electric products and the fact that they are made by the largest manufacturers of bare and insulated wires and cables for electrical distribution is a positive assurance of quality.

They are as near perfection in both dependability and durability as experience, workmanship and superior materials, combined with the most modern machinery, can make them.

Bare copper, rubber covered and paper insulated, lead covered cables of Northern Electric manufacture—are designed by the most capable engineering skill and tested to ensure safety and efficiency to the fullest degree possible.

Our nearest House will be pleased to submit specifications and prices upon request.

Every Women Needs Its Help — Now
—but when the spring buying season comes, will you be ready?

Why Not Order a Good Supply of
Northern Electric
Portable Sewing Machines
NOW?

Remember the greatest need for sewing by electricity is now, when the women of Canada are so extensively engaged in doing their own as well as a large amount of patriotic sewing work at home.

The Northern Electric Sewing Machine eliminates the tiresome, back-aching treadle work of the old method, and enables the operator to do twice as much sewing without effort.

The Northern Electric Sewing Machines are of the highest grade in design and workmanship, and carry a guarantee of complete satisfaction in every way.

Several different types are obtainable in both portable and stand style machines. You can secure either vibrating shuttle or rotary type.

A Comparison

Sherardizing Steel & Creosoting Wood

The Purchasing Agent for one of the largest Hydro-Electric Power Companies, upon having the Sherardizing Process thoroughly explained to him, remarked:

"Then Sherardizing, as a method of protecting steel, is like creosoting for protecting wood."

He has since insisted upon the delivery of **SHERARDUCT** on all conduit orders.

The two processes are markedly similar, both in treatment and results attained. **SHERARDUCT** is the only Sherardized Rigid Steel Conduit. Both interior and exterior surfaces are Sherardized and further protected by coatings of a clear acid- and alkali-proof enamel, baked on. Has the combined advantages of zinc and enamel protection. Double value for one price. We can't tell you all about it here; write for complete information.

Showing "Protected" Rail Bonds being installed by the Union Traction Company of Indiana.

Doing the job right with—"Protected" Rail Bonds and Compressors

Done right—because with "Protected" Rail Bonds the soft copper strands and terminals make fitting easy and permit great compression to assure maximum conductivity.

Done right—because the "Shot-Over" Sleeves permanently protect the strands from the effects of vibration at the point where they emerge from the terminal.

Do it right in the first place—use "Protected" Rail Bonds and Compressors just as they are doing at Anderson, Ind.

Rebonding is expensive.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Eliminate the Waste
of Money on Com-
mutator and Arma-
ture repairs by using
the

"No Spark"

CARBON BRUSHES

A mint of money is wasted every year through the installation and use of brushes of an improper grade. With the correct grade of brush specified the commutator and armature last far longer and repairs are reduced to a minimum.

We will save you a great deal of expense and your engineer much worry by taking the responsibility of selecting the right grade of material. Send for our information sheet to-day.

When That Over-Strain Does Come

It may not be till next year; or it may be next month, next week or to-morrow. Any moment, your Bus Bar Supports may have to meet the strain of a surge which will threaten the safety of the plant. For the maximum safety, install

"FRANKLIN" Bus Bar Supports

The feature which is chiefly responsible for their superiority to previous types, is the replacement of clamped and cemented fittings by

Metal Bushings Moulded to the Porcelain

These bushings compensate for the unavoidable irregularities in the porcelain, and bring about an equal distribution of strains upon all parts of the porcelain. As compared with the spot-strains caused by clamped fittings, this equal distribution will increase many times over the strain-resisting capacity of your Bus Bar Supports.

Whether for present or for future reference, you should know all the advantages of these "FRANKLIN" Post Type Insulators—why they are "Stronger Mechanically and Stronger Electrically."

Universal Insulator Supports

SAVE
Time, Labor and Material

UNIVERSAL INSULATOR SUPPORTS are specially designed malleable iron clamps made in four sizes for securing Insulators to open steel framework for wiring mills, foundries, shops, bridges, piers, elevated railways, subways, train sheds—and similar structures. They are easily attached, and by their use, electric wiring for lights, motors, generators, cranes, etc., can be installed with a great saving of labor and material.

Reasons for R. & M. Fan Reliability

Reason One — The Rotor

The induction type rotor of the R. & M. Fan is built up of steel laminations which are mounted on a substantial spider. The slots are skewed to give a uniform torque and quiet operation.

The rotor conductors are solidly riveted to the end-rings and soldered, which insures uniform contact at all connections throughout the life of the fan.

A high grade hardened steel is used in the shaft, and the journals

are accurately ground to guage, insuring smooth operation, and long life for the bearings. A groove in the shaft just inside the journals prevents the oil from running along the shaft into the stator windings.

Every rotor is carefully balanced to eliminate vibration and insure smooth operation.

Under ordinary conditions every R. & M. Rotor is good for a lifetime of service.

A Practical Illustration of Domestic Electric Heating

In this issue we print an interesting description of an electrical house-heating system which, in the completeness of the records, leaves little to be criticised. Naturally it corroborates to a high degree the figures that have been so often worked out theoretically and the chief interest attaching to this installation perhaps is the fact that the coincidence is so well marked. Certain as we may be of our mathematical conclusions it is always satisfactory to have an ocular verification of them and this is exactly what the plant described has done—proven that electric heating is feasible, that it costs just so much and that in point of convenience and luxury it is as good in practice as in theory.

Quite a good deal has recently been made of the argument that if the whole of the supply at Niagara Falls could be available there is not nearly enough to heat the buildings in south-western Ontario or, indeed in Toronto alone. No doubt this is quite true, but it also is doubtless true that it will be a long time before all of this district asks for electric heating. By that time we may have solved our own lignite supply problem or Dr. Steinmetz may have started manufacturing electric energy by utilizing the sun's energy. In view of the threatened difficulties in our hard coal supply the wisest course would seem to be to develop all our water power with the greatest possible speed so that we may have them ready when we want them—not five years after we are all frozen up and our industries put out of commission.

There is quite a good deal to be said, too, in favor of an

electric heating load which would be used in summer for some industrial purpose, say the fixation of nitrogen for fertilization, or other purposes. Also it is also reasonable to suppose that some improvement can be made in the house heating system described, so that power could be released for individual purpose during the day and stored for heating purposes during the night. The installation under consideration had a water tank two feet in diameter and two feet deep. Why not a tank ten feet in diameter and seven feet deep, if necessary, occupying the space now required by the furnace and the coal bin. The results of this experimental installation show that with power at about .4 cents the cost of electric heating will compete with the coal heated furnace, with coal at present prices. If the load factor could be arranged, this figure would be acceptable to many a central station.

An Important Water Power Conference of Dominion and Provincial Interests

A most important conference of Dominion and Provincial Engineers was held in Ottawa, on January 16th and 17th, under the auspices of the Dominion Power Board, of which the Hon. Mr. Meighen, Minister of the Interior, is chairman. Mr. A. St. Laurent, the vice-chairman of the Board, who presided, stated that the recent crisis regarding both fuel and power had brought the tremendous importance of both very prominently to the front, and shown with greater force than ever the necessity of developing and conserving our water powers to the utmost. The first step to this end, seeing that various authorities are handling the problem in different parts of Canada, is to, as far as possible, arrange their methods and organizations along similar lines, viz., the standardization of field and office methods and equipment, uniformity of publications, both in matter and arrangement, period to be covered by each, etc., etc.

The administrative end also had to be considered, with a view to making the requirements and regulations of all the authorities concerned, whether Federal or Provincial, as uniform as possible.

There were present at the Conference, Messrs. H. G. Acres, chief hydraulic engineer, Hydro Power Commission, Ontario; Arthur Amos, chief engineer, Hydraulic Service, Quebec; R. J. Burley, Reclamation Service, Ottawa; E. F. Drake, Reclamation Service, Ottawa; C. O. Foss, chairman, N. B. Water Power Commission; T. W. Gibson, Deputy Minister, Crown Lands, Ontario; H. W. Grunsky, legal adviser, Dominion Water Power Branch; J. T. Johnston, assistant chief engineer, Water Power Branch; E. B. Jost, engineer, Department of Railways and Canals; R. S. Kelsch, consulting engineer, Montreal; O. Lefebvre, chief engineer, Quebec Streams Commission; K. H. Smith, engineer, Nova Scotia Water Power Commission; R. G. Swan, chief engineer, British Columbia Hydrometric Survey; Wm. Young, Comptroller of Water Rights, British Columbia; together with the following Ottawa members of the Power Board: A. St. Laurent, vice-chairman; W. A. Bowden, D. B. Dowling, B. F. Haanel, C. N. Monsarrat, John Murphy, J. B. Challies.

As a basis for a uniform system of locating any and all water resources, and analysing and filing all data of whatever kind concerning them, which is the first requisite to co-ordinated working, there was laid before the meeting a Water Resources Index-Inventory, designed by the Dominion Water Power Branch, and which the Dominion Power Board submitted as one which would suit the needs of any and all authorities concerned with water investigation, whether Federal or Provincial. The basis of the system is the dividing of the country into its main or basic water sheds, eleven in number, with sub-basin and other divisions. Combined with this

are detail maps, a card index system, and a folder equipment, the whole forming an indexing and filing system adaptable to the needs of all the various organizations concerned with any type of water investigation or administration.

Following a lengthy discussion as to how various local conditions would be covered it was shown that the system was of such flexible and comprehensive nature as to be adaptable to practically any needs that were likely to arise. In view of this, and of statements by several of those present that they already had the system in use in their offices, in whole or in part, a resolution was passed by the Conference recommending the adoption of the system by all Federal and Provincial authorities concerned, and further, to facilitate its adoption, that an explanatory monograph on it, accompanied by maps, diagrams, etc., be published for general distribution.

Meteorological data, as a fundamental branch of water survey, was discussed at some length, it being pointed out that continuous and complete meteorological figures were often of inestimable value in deciding as to the water likely to be available for either domestic, irrigation, or power purposes. In view of this, a resolution was passed aiming towards extending the work of the service.

The next matter considered was the co-ordination of the work of investigating water resources, it being pointed out that in view of the fact that several Federal and Provincial organizations were at work on the same matter, in different sections of Canada, it would greatly help if their field and office procedure and their equipment, and finally their publications, could all be largely standardized, both as to form and contents. A resolution was passed recommending the yearly publication of hydrometric data, each report to cover a climatic year extending from October 1st to September 30th; and to include daily discharge records, but daily gauge heights only in those special cases where they are obviously necessary. The Power Board is to prepare and distribute a key map showing the territories covered by the different organizations and surveys. Other details were thought to be so many and so complex as to require extended consideration, and it was decided to leave them for definite decision at later conferences, one in the West and one in the East, after which another and plenary conference at Ottawa would make final recommendations on the whole subject.

The final matter before the meeting was that of Water-Power Regulations, the question being introduced in the form of a report prepared by Mr. H. W. Grunsky. As the subject is an exceedingly large one, and the report most comprehensive, it was felt that it was impossible to do anything but discuss the main divisions, six in number, viz.: Nature of Franchise, Control of Stock and Bond Issues, Rentals, Renewed Provisions, Extent of Properties taken over if license terminated, and Compensation therefor, in a preliminary way, leaving any decision thereon to a future meeting. Practically all those present took part in the discussion, which covered such points as Sale or Rental, Limited vs. Indefinite Franchises, Nominal or Substantial Rentals, Uniform Canadian Regulations, etc., etc., after which the meeting adjourned, first deciding that after the organizations more particularly concerned had gone further into the matter, the Dominion Power Board should call another Conference on the subject.

Government officials at Washington have made public some details in connection with the wartime development of under-water wireless. In practical use the new system is, up to the present time, employed only for receiving and it is said that radio messages sent out from powerful stations in Europe are now being read at underground receiving stations in the United States—in some cases better than when caught by the air stations. It is said to be the development of James H. Rogers, a scientist of Hyattsville, Md.

Commissioner Harris at Toronto Section A.I.E.E.

It was a very interested assembly which listened to the lecture by Works Commissioner R. C. Harris, at the Engineers' Club, on Friday, January 17, on the occasion of the Toronto Section A. I. E. E. semi-monthly meeting. The subject of the lecture was the Bloor Street Viaduct and this was, we think, the first time since the viaduct has been opened that it has formed the subject of an authoritative address. Mr. Harris in his usual attractive style gave a historical sketch of the development of the city of Toronto east of the Don River and showed how for a long time the means of access across the valley had not kept pace with the growth of this district. This territory was first approached by a low level bridge crossing the Don at Queen Street which also intersected the main lines of the C. P. R. and the Grand Trunk Railway on the level. In these days the only transportation east of the river was afforded by a gravel train which, hauled by a wood burning locomotive traversed the two and a half miles from the Don bridge to Ben Lamond, (now St. John's cemetery) and occasionally hauled a double decked passenger car. The situation was improved when the high level bridge was erected at Queen Street; also by the construction of the viaducts at Gerrard Street and Wilton Avenue. At the same time the population had increased so as to demand still greater facility of access, for in 1918 the inhabitants of the city east of the Don amounted to more than those in all the city of Hamilton.

The first proposal for a bridge on the site of the present structure was made about twenty years ago and was based on the crossing being made at a low level there being a down grade approaching the bridge on each side. Several alternative proposals were subsequently submitted, but for many years it was impossible to secure the vote of the people in favor of the scheme. During the regime of Mr. C. H. Rust, as city engineer, a more ambitious plan was introduced by which the alignment would be constant throughout from Bloor Street to Danforth Avenue; this would have necessitated considerable structural work to bridge the Rosedale Ravine at a very small angle and all things considered it was thought better to adopt the plan which has now been followed. In this the roadway swings south from Bloor Street and skirts the southern side of the ravine turning north so as to cross it at the head of Parliament Street. It then swings east in direct alignment with Danforth Avenue and crosses the Don on five magnificent spans. The width is maintained at 86 feet throughout.

The foundation proved a matter of some difficulty as it was found that the rock shelved away very rapidly on approaching the river bed and it was necessary to go down forty-six feet to reach bedrock. The matter of steel versus concrete was very thoroughly debated and an engineer from the Works Department visited a number of installations in the United States to gather information on this point. It was found that the best and most conservative opinion was in favor of steel for a structure of this size in the latitude of Toronto, and the decision was made to employ steel for the Bloor Street Viaduct.

Mr Harris showed quite a number of slides depicting different aspects of the work and the photograph of the engineers concerned was received with enthusiasm. In moving a vote of thanks to Mr. Harris, Mr. MacLachlan commended the idea of having frequent addresses on matters of local engineering interest. There were right here in Toronto works of a magnitude unsurpassed anywhere in America and as a rule the citizens were most ignorant of them.

Heating Our Homes with Electricity

A Pioneer Installation in Toronto Which Proves that Electric Heating is Entirely Practical—Cost Not Prohibitive for the Well-to-do Citizen

In the popular mind there has been a growing feeling for many years that the general use of electricity for house heating would be an eventuality of the near future. Newspapers have explained away all the difficulties and aspirants for municipal honors have included it in their programme of promised immediate reforms. Only the stupidity of the engineer, who has failed to understand the situation and grasp the opportunities within his reach, has retarded this modern development.

However, when seriously considered, there are two obstacles which, though not insurmountable, (because no obstacle is insurmountable, according to Captain Carpenter of Zeebrugge fame), nevertheless are rendering the solution of the electric heating problem difficult. First, the coal is high, and second, the supply is not unlimited. Apparently there is not enough energy in all our water powers to supply the whole country with heat and there would be comparatively little to gain by transforming coal into electric energy for heating. The fact that we have twenty-five million horse power, and more, running to waste in our water powers in Canada, however, is something of an encouragement, and justifies us at least in considering what we might do if we had a larger and all-sufficient supply. On the supposition that we have ample power for the purpose of electric house heating it really seems open to argument that we are approaching a time when the cost might be made sufficiently attractive to a percentage at least of our population. When coal was selling at \$6 and \$7 a ton it was argued that electricity must be obtainable at one-fifth cent per kw.h. However, the last two or three years have changed the whole situation. In Toronto coal is selling at \$12, and a certain uncertainty always must attend the supply. In towns in the immediate neighborhood of Toronto, \$14 and \$15 is being paid, which means that electric heating would be feasible at a cost of about .4 cents per kw.h. Now this is not an unheard of power rate with a good load factor, and the only other difficulty here seems to be that the heating load is a seasonal one. It is all right while it lasts—for six months of the year—but for the other six months it would be neces-

sary to establish industries to take care of the same amount of electric energy as is required during the coldest winter months.

Electric heating is being used already very largely for auxiliary purposes. There are a large number of homes in our cities and towns where one or two little heating devices are requisitioned to supplement the coal furnace on extra cold days or in the late fall and early spring, and the fact that this practice is becoming ever more general and is giving a wonderful amount of comfort and satisfaction, indicates that people, after once using electric heating, soon come to appreciate that there are other things to be considered about it than mere dollars and cents. There are not many cases on record, though, of whole houses being heated electrically and where such experiments have been tried, the data has been more or less intermittent and lacking in accurate detail. Such as have been obtainable we have reproduced from time to time in the Electrical News and so far as comparisons could be made these results have always appeared to bear out in fair degree the figures advanced by theory. However, we are now in a position to describe an installation of household heating by electricity with an accuracy of detail which, we believe, has never before been possible. This installation is in the home of Mr. J. B. Kitchen, 23 Tyndall Avenue, Toronto. Mr. Kitchen had the installation put in under his own supervision and has personally watched its operation and collected and compiled the data.

The system was installed in the winter of 1916 and during that season the preliminaries were all arranged and the installation completed in detail so that everything was in working order by October 1, 1917—the beginning of last winter's heating season. From October 1 to May 17, 1918, data was compiled every day on the outside temperature, the inside temperature and the current consumption. The outside and inside temperatures were taken by a recording curve drawing thermometer and the consumption was registered on a recording watt meter. The outside thermometer was placed in a favorable location for obtaining the correct

Fig. 1—General view of installation in Mr. Kitchen's basement—A and B respectively the coal and electric boilers

outdoor reading and corresponded very closely with the readings taken at the Observatory and published day by day. The inside thermometer was placed as nearly as possible in the centre of the house, on the ground floor, the rooms being connected in the usual way by open doorways, so that the whole house was at the same temperature throughout.

The house is a detached semi-bungalow type with about two feet of space on one side and seven or eight feet on the

Fig. 2—Close up view of control equipment

other. Tyndall Avenue runs north and south and No. 23 is on the east side so that the house is facing west. It is the regular builders' type, 23,000 cubic feet in volume, 8 rooms, brick walls, wood shingles. The maximum capacity of the heater elements is 24 kilowatts, so that the installation works out at 1.04 watts per cubic foot of air space. The windows and doors are equipped with metal weather strip, but there are no double windows or doors and no vestibule.

It is important to remember, too, that these figures were taken for the coldest winter ever recorded in the city of Toronto, compared with which the present January feels like regular summer weather.

Apparatus and Control

When the house was built it was equipped with an ordinary hot water heating system. For the purpose of electric heating the coal furnace was simply paralleled with a hot water boiler two feet in diameter and two feet high, which was equipped with five 4.8 kw. nichrome heating elements immersed in the water. The elements and the tank were enamelled inside with "Bakelite." The outside of the tank was covered with 2 in. of corrugated asbestos covering. The five elements were separately fused and connected to a 3-pole circuit breaker, so that two of the poles had each two feeders in parallel and the other pole had one feeder, this method being used for fineness of control.

As the electric boiler was paralleled with the standard coal heat boiler, circulation was prevented through the latter by

the use of stop cocks on the hot water feed. These can be seen in the photograph of the installation. By turning these cocks at any time the system could be heated from the coal furnace or, indeed, both sources of heat could be used in parallel. However, this arrangement was simply for emergency purpose as it was not found necessary, even at 20 degrees below zero, to requisition the coal bin.

The control consists of a Minneapolis thermostat placed centrally about four feet above the floor on the first floor, (close to the indoor recording thermometer spoken of above).

Tables II. and III.—Weekly kw.h., monthly kw.h. and monthly cost the house at any pre-determined degree. The whole of the interior of the house was heated exactly as it would have been if coal had been used. Mr. Kitchen is also authority for the statement, and indeed this is borne out entirely by the chart, Fig. 3, that a much more even temperature was obtained throughout than would have been possible with coal

Statistical Analysis of the Central Electrical Station Situation of Canada

(From our Special Ottawa Correspondent)

Electrical energy provides an ideal source of power for practically all classes of manufacturing, for the operation of street railways, for the operation of mines, for municipal and domestic lighting, and for innumerable other activities. Its use in these fields is developing with remarkable rapidity. Other fields, such as the electrification of steam railroads, the smelting of ores and the expansion and increasing scope of electro-chemical and electro-metallurgical industries, offer vast scope for future development. The growth of the central station industry in Canada has been rapid, particularly during recent years. The larger electrical systems, both commercial and publicly owned, have been widely extended from year to year, opening up new territory in the electrical distribution field.

In order to properly measure the scope of the industry and to gauge its importance to commercial and industrial interests, the Dominion Water Power Branch of the Department of the Interior, in co-operation with the Dominion Bureau of Statistics of the Department of Trade and Commerce, has had under way during the past year, an exhaustive analysis of the central electric stations of the Dominion. The analysis of the statistics collected has been completed within the past few days. As some time must elapse before the complete report can be published and distributed, a brief synopsis of the statistical data has been prepared.

The report consists essentially of two sections: the first comprising the introduction and an analysis of the statistics, the second forming a comprehensive directory of the central

station industry covering concisely and systematically the principal features of the commercial and publicly owned systems and stations in operation throughout the Dominion.

4th.—Making available to those interested the locations where blocks of electrical energy are for sale, the prices at which this power is obtainable and the transportation facilities available in the vicinity.

In considering the statistics which are summarized hereunder, it should be borne in mind that the figures have re-

Fig. 2—Central Stations—Total primary power by provinces, 1917

ference solely to central electric stations, that is, to stations which are engaged in the distribution and sale of electrical energy. Where central stations are interwoven with other activities, such as the operation of electric railways, of mines, of pulp mills or of other industrial enterprises, the central station equipment, capitalization and other statistical data secured has been wholly diversified from the allied industry. This line of severance has been drawn through the entire statistical analysis. Central stations purchasing power in bulk for purposes of re-sale are included in the financial and staff statistics.

A summary of the statistics is presented in Table 1, which analyzes the outstanding features disclosed by the census returns, and shows the relationship between commercial and municipal or publicly owned stations.

The total number of central electric stations recorded is 666, of which 323 are commercial stations and 343 are municipal. Examination of the figures however shows that the excess in municipal stations is attributable to the non-generating station. Of the stations with generating equipment, 296 are commercial and 174 are municipal. Of the stations without generating equipment 27 are commercial stations and 169 are municipal. The Hydro-Electric Power System of Ontario is largely responsible for the large proportion of municipal stations purchasing power in bulk.

The outstanding features of the statistics are covered in the succeeding tables.

Power Equipment Installed.

Table 2 summarizes by provinces the number, kind and horse power of the primary power machines installed in central electric stations on January 1st, 1918. The primary power totals 1,844,571 h.p., of which 78.3 per cent. or 1,444,314 h.p.,

Fig. 1—Central Stations—Character of Power, 1917

electric stations of the Dominion. The purpose lying behind the compilation of the data is four fold.

- 1st.—A stock taking of Canada's present central station facilities with provision for expansion.
- 2nd.—An analysis of the statistical data collected, for the purpose of noting the characteristics and trend of the industry.
- 3rd.—The preparation of a complete directory of the central

is installed in commercial stations and 21.7 per cent. or 400,257 h.p., in municipal stations. Of the total primary horse power installed 1,652,661 h.p. is derived from water, 180,200 from steam, and 11,710 from gas and oil. From the above figures it will be noted the 89.6 per cent. of the entire primary power in central stations in Canada is derived from water.

Power Equipment per Capita.

Table 3, showing the relation of the primary power installation to the population by provinces, affords an interest-

Fig. 3—Central Stations—Water vs. fuel power by provinces, 1917

ing basis for comparison and analysis. The total primary power installed in central electric stations throughout the Dominion averages 221 h.p. per thousand population. Yukon averages the highest with 1,206 h.p. per thousand population, British Columbia coming next with 376 per thousand, Ontario, with 286 per thousand; Quebec, 271 per thousand; Manitoba, 118 per thousand; New Brunswick, 49 per thousand; Nova Scotia, 34 per thousand; and Prince Edward Island, 13 per thousand population. Population by provinces is the only feasible basis available for making a per capita analysis of the central station industry. The occupation of the population, and its varied density in different localities have a direct bearing on the market for electrical power, and consideration of these phases will assist in explaining the above variations in the per capita development.

Hydro-Electric Power and Central Station Industry.

One of the most important features disclosed as a result of the statistics (see Table 2) is the outstanding position

which water power takes in the central station field. Out of a total installed primary capacity of 1,844,571 h.p., 1,652,661 or practically 90 per cent., is derived from water. This figure is indicative of the extent and availability of the water power resources of the Dominion and of the remarkable degree to

Fig. 4—Central Stations—Steam engines and steam turbines by horse power capacity of units, 1917

which their adaptability for central electric station work has been appreciated in principle and realized in practice. The vast water power resources of the Dominion, the ready adaptability of hydro power to the production of electrical energy and the increasing extent and scope of economical electrical transmission, form an industrial asset which probably more than any other will ensure a full measure of future prosperity.

The Yukon develops 97.4 per cent. of its primary central energy from water. Ontario develops 95.7 per cent. from water, indicating markedly the commercial adaptability of water power for central station work, even where in com-

Fig. 5—Central Stations—Water wheels and turbines by horse power of units, 1917

petition with convenient and reasonably cheap coal supplies. Manitoba develops 95.2 per cent. of its central station energy from water, Quebec 94.9 per cent., and British Columbia 89.8 per cent. Alberta develops 43.2 per cent. from water, although

Table 1.—Central Electric Stations:—Summary of Principal Features, 1917

	Total	Commercial stations	Municipal stations	Percent of total. Commercial	Municipal
1	2	3	4	5	6

Number	619	456	163	73.7	26.3
Horse power	1,652,661	1,322,852	329,809	80.0	20.0
(3) Gas and Oil Engines:					
Number	113	52	61	46.0	54.0
Horse power	11,710	4,010	7,700	34.2	65.8
Electrical Generators:					
Number	943	627	316	66.5	33.5
Kv.a. capacity	1,387,521	1,086,546	300,975	78.3	21.7

an abundant supply of coal is available. New Brunswick develops 38.8 per cent. from water power, Nova Scotia 19.2 per cent. The percentage of water power used in central electric stations in Nova Scotia is low although the province is exceptionally endowed with available water power resources. An abundant coal supply indicates a reason for this condition. The city of Halifax is served from a steam driven plant, the

Fig. 6—Central Stations—K.v.a. capacity by provinces, 1917

largest central electric station in the province. The present tendency in the province is, however, towards the increased use of hydro power. In Prince Edward Island only 13.9 per cent. of the central station power is derived from water. Topography and area of the Island province explain the lack of water power resources. In Saskatchewan, no water power is developed. Here the topography of the province is solely responsible, the entire settled portion being located in prairie country, which is not naturally endowed with attractive water power sites.

Fig. 1 presents in graphical form the comparative importance of the primary sources of power in the central electric station industry in Canada. Fig. 2 presents by provinces the total primary horse power installed in central electric sta-

Fig. 7—Central Stations—Capital invested by provinces, 1917

tions, and Fig. 3 shows the relation between installed water and fuel power in the various provinces. Fig. 4 presents the relation between steam reciprocating engines and steam turbines in central electric stations by horse power capacity of units. Fig. 5 shows the comparative total water wheel and turbine installation by horse power of units, and Fig. 6 presents by provinces the kv.a. capacity of the generators installed.

Employees, Salaries and Wages.

Table 4 presents the principal features of the statistics respecting employees, salaries and wages. For the entire Dominion the number of employees in central electrical stations totals 8,847, with salaries and wages aggregating \$7,777,715. Of this total 5,135 are employed in commercial stations

with salaries aggregating \$4,290,505, and 3,712 in municipal stations with salaries totalling \$3,487,210. The total number of employees throughout the Dominion averages 4.8 per thousand installed primary horse power. The total salaries and wages paid average \$4.22 per annum per installed primary horse power. Reference to the salaries and wages per installed power capacity discloses the fact that those provinces in which are located extensive transmission systems of large central station systems, show a low salary and wage bill per installed horse power capacity. These extensive systems are in all cases founded upon water power installation. On the other hand in those provinces where central station industry is wholly or largely confined to individual stations for local purposes, the unit salaries and wages cost per installed capacity is high.

Financial Statistics.

A few of the outstanding financial features of the industry are set out in Table 5. The capital actually invested in central electric station industry totals \$356,004,168, of which 79.5 per cent. is invested in commercial stations and 20.5 per cent. in municipal or publicly owned stations.

The capital indirectly dependent upon electrical energy is enormous. No attempt has been made to go into this phase in this report. As showing the general dependability of the modern community upon electrical energy, reference might be made to the city of Winnipeg. According to a very careful and complete analysis made by the Dominion Water Power Branch in 1915 of the interests in Winnipeg which were to a greater or less degree dependent upon hydro-electric power derived from the Winnipeg river, it was shown that

capital was involved to the extent of \$169,260,963, and this on a power installation of only 55,400 h.p. The total central station power installed in the Dominion is 1,844,571 h.p.

The total revenue received from the sale of electrical energy in 1917 was \$44,536,848, of which \$29,135,399 was secured by commercial and \$15,401,449 by municipal plants.

In securing the statistics concerning capital, the actual cash investment in the central station activities was called for, apart from the consideration of stock and bond issues. The resulting figures are therefore of particular interest as a basis for determining the investment cost per horse power installed.

The figures indicate that the actual average cost per installed horse power for the Dominion is \$193. This cost includes all capital invested in construction and equipment of hydraulic works, power stations, transmission and distribution systems; real estate; cash on hand; current assets; supplies, and all other similar items.

Capital Invested in Hydro Power Central Stations.

Of special interest are the figures relating to the capital invested in hydro power central stations. The average capital cost per installed horse power for the Dominion is \$188. Referring to the table, the investment per turbine horse power in Alberta appears remarkably low. This is partially explained by the fact that in the analysis the distribution system in the city of Calgary is not charged to the hydraulic developments serving the city.

Of special interest, too, is the actual cost of construction of hydro-electric power stations per installed horse power. Omitting all real estate, transmission and distribution equip-

ment, seventy representative hydro-electric stations throughout the Dominion with an aggregate turbine installation of 745,797 h.p., and a total construction cost of \$50,740,468 show an average cost of \$69.11 per installed turbine horse power. This figure in brief represents the average capital cost of construction at the power site and is of considerable interest to engineers.

Fig. 7 presents by provinces the capital invested in water and fuel power central electric stations.

A comparison of the central station statistics of Canada with similar figures in the United States would be of interest. Unfortunately the 1917 census returns of the United States will not be ready for publication for several months. While it is scarcely fair to compare our 1917 returns with the 1912 returns in the United States the figures may be instructive. The proportion of central station power derived from water in Canada is practically 90 per cent. In the United States in 1912 the hydro power portion was 30 per cent. of the total. The water power used in central station work in Canada averages 198 installed horse power per thousand population. In the United States in 1912 the similar figure was 24.7 h.p. per thousand population.

While the ratios in the United States have undoubtedly very materially increased during the past five years, there is little doubt but that the ratios for the Dominion are still substantially in advance of those in the United States.

Heating Our Homes With Electricity

(Continued from page 25)

heating. The thermostat was set for 70 degrees from 6.30 a.m. to 10 p.m., and for a slightly lower temperature throughout the remainder of the twenty-four hours.

Temperature and Consumption Curves

It will be noticed that there are certain minor variations occurring between the kw. hour curve and the outside temperature curve. Three factors entered into these variations, namely, (1) velocity of wind, (2) direction of wind, and (3) humidity, the first two being of most importance. These, of course, apply to all types of heating and are specially noticeable with hot air systems. It would be humanly impossible to get rid of the effect of these factors unless the house were built with much thicker walls and, so, less sensitive within to conditions without. The chart on P. 24, the first of its kind, we believe, ever prepared and published, shows from day to day the indoor temperature, the outdoor temperature and the kw. hours consumed. Notice the very satisfactory regularity of the indoor temperature curve. On one occasion only, with power off, the temperature dropped to 50 degrees,

though the outside temperature at the time was approximately zero. On four other occasions only for short periods did the temperature reach 60 degrees. Also it is worthy of note that during the whole period the desired temperature of 70 degrees was never exceeded.

The chart of the outside temperature shows that during the months of December, January and February the temperature hovered around the zero mark almost continuously. On February 4-5 twenty degrees below zero was reached. At this time also the maximum current consumption was required—about 475 kw.h. per day. The highest weekly consumption for the season also occurred at this time—2,600 kw.h.—though on other occasions 2,580, 2,570, 2,560 and 2,500 kw.h. were used up in the week. The weekly consumption, week by week, is shown in Table I and the monthly consumption in Table II. The total kw. hours for the season, October 1 to May 17, seven months and a half, was 52,700 kw.h.

The cost is, of course, a matter of local conditions. The domestic rate in Toronto is one cent per kw.h., less 10 per cent., on which basis the cost for the year works out \$480.18. The power rate is based on the standard a.c., three phase, 25 cycle, 550 volt rate of service, namely: \$1.25 per h.p. per month for the first 10 h.p. of maximum demand and \$1.00 per h.p. for all excess; energy charge up to the first fifty hours monthly use of maximum demand, 1½ cent per kw.h.; additional consumption for the second fifty hours monthly use of maximum demand, ½ cent per kw.h.; remaining consumption .15 cent per kw.h.; the whole subject to a cash discount of 20 per cent. Figured on this basis the cost of heating for the whole season is \$259.99. This is also shown in Table III., where it is also indicated that the maximum demand was 26 h.p. and varied from that figure down to 13 h.p. during the six winter months, dropping to 7 h.p. in May, just before the furnace was shut off.

Of course it is impossible to say what the consumption of coal would have been in this house during the winter of 1917-18, but a conservative estimate would doubtless be twelve tons, as in the winter of 1914-15, a much milder season, 10½ tons were used. Coal is now selling at \$12 a ton which would bring the coal cost to \$144. On the supposition that a man is paid \$5.00 a month for attending the furnace for seven months—a conservative estimate again, we believe—this would bring the total coal cost to \$179, considerably more than half the cost at the power rate and also considerably more than one-third the cost at the commercial rate.

For the information contained in this article we are indebted to Mr. J. B. Kitchen, himself who is certainly to be congratulated on this very fine and valuable piece of pioneer work.

Electric Railways

Financial Men Say Electric Railway Situation is Serious—Interests of Both the State and the Public Best Served by Adequate Rates*

Investments in public utilities are not protected merely by the constitutional provision against taking property without just compensation and by the moral obligation of state to protect invested capital and promote enterprises upon which the industries of the country in war and peace are so dependent. It is also now appreciated and publicly declared that the interests of the state and of the public are served and promoted by permitting rates which are sufficient both to insure adequate service and to create such credit for the operating companies as will attract the necessary capital to provide up-keep of the properties and their expansion. Thus private investment in public utility securities is protected in principle not only by the law but by the recognized interests of the state, the community and the public served.

While these principles have been so widely recognized by many commissions in recent months, and increased rates have been granted to many companies, the increases in rates to the utilities of the country as a whole have by no means equalled the increases in the costs of operation resulting from higher prices of fuel and materials and high wages. The development of commission regulation and the appreciation of its obligation to the public to encourage efficient service must operate to increase rates too low to protect interest or attract additional capital for utility expansion.

Electric Railways Particularly Affected by War

Electric railways have been particularly and seriously affected by the war through increased demands for service, fixed fares, high money rates and attenuated credit. The fundamental cause of the present conditions is the inadequacy of receipts to meet the cost of that character and extent of service rendered by many companies. The demand is constantly for service costing more than it returns. It will of course be difficult, if not impossible, to decrease the amount or lower the character of the service to which the public has become accustomed.

In the congested centres much may be done in decreasing the costs of operation through the introduction of one-man cars, skip stops, standardized equipment, staggered hours and reroutings, and the elimination of unprofitable runs. The authorities may aid in reducing the costs of operation by eliminating franchise charges and special taxes, street paving, street watering and the like.

These modifications of operating costs are at the best merely palliative. They do not alter the fundamental fact that under the present conditions and the present costs of material and labor, many street and interurban railways are furnishing, in response to the demand of the public, a ser-

vice which costs more than they collect in fares. Appeals for higher rates have been inadequately met by local authorities, by state commissions, and, in cases where it has jurisdiction, by the Interstate Commerce Commission, and in some cases increased fares have caused a falling off in travel and resulted in little, if any, actual increase in gross revenue.

The community with adequate and efficient street-car service is busy, growing and prosperous; while the town, large or small, which has inadequate local transportation is dull and dead, or dying. As the prosperity of the community as such is more important than the convenience and comfort of the individual, so is the interest of the community in adequate transportation greater than the interest of the individuals who enjoy it. It follows that if efficient local transportation adequate to the needs and welfare of the community costs more than can be collected from the fares paid by the patrons, the excess of costs over receipts must be paid by the community in some form, or the community will suffer from the lack of that kind of transportation which it requires for its industrial and social needs.

In cases where street car operations are unprofitable because of local imposition and taxation, these burdens must be removed or private capital will not provide the service required by the public. If the street-car operations are unprofitable because the fares are too low, the public is and always will be the chief loser from low fares and the chief beneficiary from a higher fare which will permit successful and profitable operation. If the cost of service for any reason is so much above the receipts that an increase of fares to cover the deficit would result in a decrease in the use of the service and therefore no increase in revenue, the public interest may demand that the service required be supplied at public expense supported by taxation.

The recent Bay State, and Boston Elevated acts are particularly interesting in recognizing the necessity for the continuance and expansion of efficient traction service to the extent of providing, in the Bay State case, that certain serial bond payments if not earned shall be made up out of taxation, and in the Boston Elevated case that all deficits in operation, including depreciation, renewals and interest and dividend payments shall be made up out of taxation. These two Massachusetts acts and the general one all provide for flexible fares, readily changeable, either up or down, to meet varying costs of operation and requirements of service. The result of operation under these acts will be watched with great interest, both by electric railway operators and by investors in the securities of public service corporations.

In other cases where the receipts are not sufficient to provide the costs of the service required by the public, the states or the communities served will be faced with the alternatives of either paying deficits in operation or of taking over the properties by purchase and operating them as state or municipally owned institutions. The result will be the same so far as the service costs more than the revenues—the public must pay the difference through taxation. But

*Abstract in Electric Railway Journal of committee report presented before meeting of Investment Bankers' Association of America in Atlantic City on December 10, 1918.

taking over the properties involves the withdrawal of large amounts from the taxable property of the community, and all the problems and difficulties of public ownership and operation, which it is believed the American people do not desire to undertake. The whole situation is difficult and very serious.

It is believed that the study of electric railway problems by owners, operators and regulating officials, particularly if they find a basis for co-operation in the principle that the public demands and must pay for adequate local transportation, will point the way to a solution of the electric railway problem which will protect existing investment, assure the companies the credit required for expansion, and give the public the local transportation necessary to its welfare and health. The interest of the investors presents the study of this problem as one of the first duties of the public service securities committee of the Investment Bankers Association during the reconstruction period.

Depreciation Should be Provided for.

The war and the results of operation under war conditions and high costs have given the subject of depreciation more than an abstract or academic interest, since it is observable that those companies which have made adequate provision for depreciation meet the present emergencies with less difficulty than those companies which have not done so.

Public utility commissions, operators and investment bankers should all be equally interested in seeing that funds devoted to public use are not impaired through failure to make provision out of earnings for both maintenance and replacements, in such a way as to maintain the full efficiency of the property and preserve the integrity of the investment. No other course is honest, rational or expedient. It is honest,

stood in its relations to such subjects as power supply, fuel conservation, labor economy, and the distribution of population and of wealth-producing agencies in industry.

If our national representatives take up the consideration of federal aid or supervision of public utilities as their importance to the whole country becomes more apparent, they will approach the subject with full knowledge of the effects on the country's industrial efficiency of the loss of credit of the steam railroad companies, resulting from restrictive legislation and repressive regulation by the Interstate Commerce Commission. And it may be hoped that they will give due weight to the experience of public regulation of utilities through state commissions, that the interests of the state and of the public are best served and promoted by permitting rates which are sufficient both to insure adequate service and to create such credit as will induce the investment of capital needed for expansion.

Zone System of Fare Collection

At the recent convention of the American Electric Railway Association, Mr. L. S. Storrs discussed the applicability of the zone system of fare collection to North American railway systems and maintained that little relief could be looked for in that direction. Mr. J. H. Moir, of the Edmonton Municipal Railway System, answers Mr. Storrs' argument in a current issue of the Electric Railway Journal. Mr. Moir quotes conditions in the Old Country and explains that the system, as used there, is really not so complicated as it looks on the surface. For the information of Canadian readers we reproduce Mr. Moir's letter:

Mr. Storrs maintains that the European system of col-

because the public should pay for the depletion of property and capital through wear and tear and obsolescence exactly as it should pay for other costs of using private capital and property for public use; rational, because in time the public would otherwise be deprived of the property and consequently of the service through its destruction in public use without replacement; expedient, because private capital can be attracted to public service only if protected against loss.

National Aspect of Utilities

The experiences of the war have confirmed the conviction of the American people that, for rapid and economical industrial production private capital under private management is more efficient than government ownership or operation, and that co-ordination in the national interest of national effort to a common end may be effected by national agencies, through general consent and co-operation without government ownership or operation or the exercise of the powers of absolute control.

State regulation and supervision is sufficient for local service; national supervision, and not only supervision, but encouragement and support, may be urged, as public service becomes increasingly national in scope and is better under-

standing fares is no guide for the adoption of the zone system on American electric railways. From my experience I would say that there is no better system for large cities. A large proportion of the electric railways in the old land are able to pay dividends to the stockholders and, where municipally owned, hand over to the treasury large sums of money after taking care of interest, sinking fund and depreciation. For instance, the city of Glasgow paid over to the treasury in 1917 the sum of \$250,000. Without a doubt that speaks well for the zone system there.

Mr. Storrs also gives figures comparing Glasgow with Columbus, and Bridgeport with Aberdeen, and discusses the railway facilities afforded on this continent and in Great Britain. The whole bone of contention appears to be the system to adopt for the collection of fares. According to his figures there are more miles of track in this country per 1,000 of population than in Great Britain, which clearly indicates that there are not so many passengers to be carried per car-mile—all the more in favor of the zone system.

I might say that the Glasgow Corporation Tramways carry about fifteen passengers per car-mile, and each passenger receives a punched ticket which represents a receipt for fare paid. If the conductors over there can punch tickets

at the rate of 150 per car-hour, the conductors on this side should be able to perform the same duty. The different denominations of money might make it somewhat more difficult, but not enough to retard the conductors in getting all the fares.

A great deal of discussion has arisen over passengers overriding the distance paid for, but a conductor should be able to keep an eye on all passengers and see that this does not occur. The tickets or checks used are of different colors, and by these a conductor knows where a passenger should leave the car.

Discussion has also arisen as to the possibility of conductors stealing fares, but with the system of checks used this is almost impossible. The checks are numbered in series and each conductor must turn in the amount of cash received for the number of checks issued.

It would be impossible, of course, to have such low fares here as in Europe, but that is a matter for each railway to decide. It seems to me that the best fare to adopt here would be 4 cents for the first zone and 1 cent for every additional zone to the end of the line. If this should not produce sufficient revenue, the zones should be shortened, but it would be inadvisable in any case to increase the fares.

I attach sample of checks which might be used on such a system. For example, a person who wished to ride one zone would purchase a 4-cent check; two zones or one zone and a portion of another, a 5-cent check, etc. If the person wished to ride the entire distance, he could buy a 12-cent check.

The collection of fares and issuing of checks is really very simple. For example, a person takes his seat in a car, say at some point between North Edmonton and Eightieth Street, and wishes to ride to 109th Street. In this case the conductor would collect 9 cents and issue a 9-cent check, punched in the column denoting the zone where the person boarded the car. This check would indicate the destination of the passenger. Should the latter override the distance, the conductor would collect an additional 4 cents. This would probably prevent any person attempting to defraud the company a second time by overriding the distance originally paid for.

When a conductor starts on his day's work, he has a stock of checks of each denomination. The total number of each is marked down on a card or form which he carries with him. The checks are put in pads of 100 and are numbered consecutively. At the commencement of each trip the number of the uppermost check of each denomination is marked on the card. At the completion of the day's work this card, with the unsold checks, will show exactly the day's sales, and the conductor must account for the money representing these sales. In case of a shortage of cash, he must make good.

The consensus of opinion at the conference of the American Electric Railway Association was that no zone system yet adopted by the railways on the American continent has proved satisfactory, and that the flat increase in the unit fare has not given the desired results. If the European system were given a trial, I am sure the results would be satisfactory.

I think it would be inadvisable for cities with a population of less than 100,000 to adopt the zone system. The reason is that with low fares a certain density of population is essential to obtain satisfactory results. In other words, the short-haul traffic is the traffic which pays best, and a low fare would tend to encourage this branch. In smaller cities a better system would be to adopt one-man cars and a higher fare.

Edmonton is experiencing at the present time the same difficulties as most electric railways, and probably a few more owing to the excessive capital investment per head of

population. We are carrying 10,400,000 passengers a year on an average fare of 5.15 cents. The total earnings for the year are \$535,000, and the total expense \$630,000.

If our fares were increased to four tickets for 25 cents, instead of five for 25 cents as at present and children's tickets ten for 25 cents (and there is an indication that this may take place in the near future), and if the number of passengers carried were 10,200,000 (a decrease of 200,000 being allowed because of the increase in fares), our fares would average 6 cents. The total revenue would then amount to approximately \$624,000.

It would be out of the question to attempt the zone system with Edmonton's present population, as we would have to earn \$90,000 more revenue to pay the additional platform expenses.

I have endeavored to demonstrate why the zone system should be adopted in large cities and the one-man car system in small cities. Should any reader desire further information with regard to the zone system, I would be very glad to take the matter up with him, as I believe this system will eventually have to be adopted.

Toronto Suburban Now Government Owned

The Toronto Suburban Railway, which operates 10.26 miles of lines on streets and highways in the western portion of Toronto and in the town of Weston, and two interurban lines on private right of way, one from Weston to Woodbridge, 13 miles; and one from Lambton to Guelph, 46.3 miles, a total of 69.53 miles, and which is controlled by Sir Wm. Mackenzie and associates, is being acquired by the Canadian Northern Railway and will be operated as part of the Canadian National Railways. The Canadian Northern is also acquiring the Toronto Eastern Railway Company's charter. This line is projected to run from Toronto to Cobourg, Ont. A contract was let and construction started in 1914, grading being done from Bowmanville west to Pickering Village, 19.5 miles, and track was laid and ballasting done from Bowmanville to Whitby, 14.5 miles. No overhead or other electrical work was done, and, owing to the war, all construction was stopped.

Moose Jaw Company May Sell to City

The Moose Jaw Electric Railway Company have just presented a report to the city council in which they offer to sell out to the city and stating if this is not considered it will be necessary for the city to grant them certain concessions in order that an adequate service may be maintained. These concessions include the cancellation of all indebtedness of the company to the city for materials or labor; the right to increase the fare to seven cents; the exemption of the company's property from taxes and mileage rates until 1930; the right to operate one-man safety cars and that certain bridge repairs be made by the city. The report further states that the company has been operating for several years during which their receipts barely covered expenses and that their present financial condition makes it absolutely necessary to either secure assistance or abandon the enterprise.

Mr. Justice Masten, in the Supreme Court, Toronto, has just awarded damages amounting to \$1,000 to a woman who was suing the Toronto Street Railway Company for \$4,000, as the result of injuries sustained when the street car in which she was standing came to a sudden stop at an intersection. The plaintiff, who is 66 years old, was thrown against a seat and her spine injured. She also claimed that passengers were subjected to severe jolting on account of a defective roadbed. The jury found that the car itself was defective in the knowledge of the defendants and that they were guilty of negligence in allowing it to be operated.

The Contractor-Dealer

The Public Does Not Care Very Much What An Appliance Costs—The Question They Ask Is—What Will It Do?

We in the electrical industry are creators; we are pioneers. We must make our own business. Whether our industry is one of a gross value of \$6,000,000,000 or \$7,000,000,000 per annum, or whether it is one of \$60,000,000,000 or \$70,000,000,000 per annum, depends upon the way we apply our energies and abilities.

That's what W. L. Goodwin says of the trade in the United States and presumably it's not different in Canada. In other words the business is there if we will just reach out and take it. And, truly, it often happens that we don't have to stretch our arms very far to place our hands right on something pretty good but Mr. Goodwin makes a strong point when he says we are pioneers. Selling electrical appliances is a different proposition to selling shoes, groceries, hosiery and what not—items the public have been buying so long they have forgotten that the human race ever did without them. Electrical appliances, on the other hand, have not yet become a part of the human being's daily life.

The successful merchandising of electrical goods requires, therefore, a somewhat more scientific method of approach than does the retailing of ordinary goods. That is, there is a preliminary, preparatory operation in the one case not required in the other. However, once this primary operation is completed there seems no reason why the recognized up-to-date methods of selling used by successful hardware, shoe or grocery men, should not be equally successful in the hands of the electrical dealer.

And this one primary step, as mentioned above, is necessitated by the fact that the general public don't yet "demand" electrical goods. They know they must have boots and so go and ask for them. But they go to an electrical store with their minds fully made up that such things are luxuries—at least so far as they are concerned. They are curious merely.

It follows that the successful contractor-dealer must keep this fact in mind. He is, in the vast majority of cases, dealing with skeptics, in effect, men and women in whom the need of knowledge of electrical conveniences has not yet shown signs of development. It is not enough then that he explain to his prospective customer that such and such will consume so much current or cost so much to operate. The essential thing in the customer's mind is—**what the apparatus will do.**

Don't let us make the mistake of thinking that "cost"—either initial cost or cost of operation—is the determining

factor in the mind of the customer. When he is satisfied that an article will add to his own comfort or that of his family and will enable him and them to get a little more into every twenty-four hours, he won't ask the price. Everybody to-day is looking for servants. If the contractor-dealer can prove that he keeps them in stock, (and he can, if he goes to it), he will find ready sale.

So, sell your customer on the argument of what your appliances **will do**—not what they will cost.

What Is Wrong With Contractor Dealers' Merchandising Methods?

During Mr. W. L. Goodwin's visit to Toronto to attend the convention of the municipal electrical engineers, on January 30-31, it is hoped that the Contractors' and Dealers' Association will be able to get him to spare them an evening. It has been suggested that Mr. Goodwin visit the various places of business of the contractor-dealers in Toronto, or as many of them as time, will permit, and that later he meet them at one of their association meetings and tell them just what he thinks is wrong with the business in Toronto and where it can be improved.

On an earlier visit, Mr. Goodwin expressed himself as disappointed with the electrical stores of this city and we have pointed out on more than one occasion what a large percentage of the electrical trade is being handled through other mediums, such as hardware and drug stores. We do not minimize the difficulty in the way of changing these conditions, but neither do we believe they are insurmountable. If Mr. Goodwin can spare the time to carry out such a programme as that outlined it will be of the very greatest advantage to the electrical dealers of Toronto to give him the right-of-way into the very heart of their business methods and then listen patiently to what he has to say in the way of criticism or approval.

Now that the war is over there are few who doubt that the merchandising of electrical supplies is going to assume much larger proportions. It will be a profitable business and the question for the contractor-dealer to decide is—who is going to do this business and who is going to get this profit?

Information for Canadian Exporters

The Canadian Trade Commissioner in London, England, has advised that, while there is not the same insistence in England on the rules and regulations governing electrical equipment in this country, there are nevertheless certain requirements to be noted. These, he says, are set forth in several publications: Wiring Rules, published by the Institution of Electrical Engineers, 1 Albermarle Street, W-1, price one shilling; Memorandum by the Inspector of Factories on Electricity regulations; Mining Rules and Regulations, published by H. M. Stationery Office, price 4d.; Standardization Rules, by British Engineering Standards Association, 28 Victoria Street, S.W.-1. The wiring rules of the Institution of Electrical Engineers are adopted by practically all the insurance companies in England. The factory and mining rules are administered by the Home Office and are compulsory on all users.

Is this depositor a Contractor-Dealer?—We hope so

Business that Awaits the Retailer

By Samuel Adams Chase*

In these days of reconstruction, it is not strange that a spirit of unrest shall have found an entrance to the field occupied by the jobber and contractor-dealer. Lawyers of the highest eminence are persuaded that both the practice of law as well as the law itself are facing changes of a radical sort. A diploma, a small black bag and a sympathetic bedside manner no longer constitute the essentials of a profitable medical career.

Change is the fundamental fact of economic progress. To recognize and accept the probability of a change is one-half of the problem; and to see its direction accurately provides the ultimate solution.

The inexperienced manufacturer of electrical appliances creates a sales policy of selling direct, forgetting the jobber, and contractor-dealer, and says they are useless; cut them out; they are carbuncles on the commercial body; they are parasites; they toil not, neither do they spin. Many of you have heard this sort of statement.

Nearly every commercial line has been attacked by this fever with the usual losses to the manufacturer, the injury to the distributor and seldom advantage to the consumer.

There is an old saying that "the longest way 'round is the shortest way home." Experimental short cuts often are costly. A multitude of greedy manufacturers have tried to sell direct at the jobber's price; a myriad of grasping retailers have tried to buy directly from the manufacturer, with the jobber's discount. So they lock horns over this trifling middle percentage and upset the stability of trade conditions very greatly to their own loss.

I am familiar with some of your problems, not all, not nearly all. But I know the confusion caused by the electric light companies when they sell electrical merchandising appliances at cost in order to increase the consumption of current. I know about the pit dug by the local contractor—into which he himself falls frequently. But although I know something of your "hard trials and great tribulations," I know also that you should occupy an impregnable stronghold.

In the first place "Possession is nine points of the law." You may say confidently with Napoleon "I am here. I shall stay." Secondly, "In union there is strength," and you will impress others through consolidating associations, as a united body.

Any plan of reconstructing the method of selling electrical merchandising appliances, through the co-operation and close alliance between the manufacturer, jobber, central station and contractor-dealer, distributing through the natural and legitimate channels will place the electrical industry in a better relation to the trade than ever before. It will make close friends of those who have sometimes been active enemies.

This would be no small accomplishment if there were nothing else; but it is only the first of a long list of benefits which will accrue—not only to the manufacturer but also to everyone interested in the electrical industry.

Why? Because the policy will give balance and stability to the commercial phase of the business. It will establish a relation which is an improvement on "live and let live" since it is based on the idea of co-operation—"live and help live."

For several years, as you know, the condition of the electrical trade in some respects has been going from bad to worse. Not that we, as manufacturers, have not made money, or that the contractor-dealers as a class have been doing business at a loss. But any business which proceeds along

other than sensible roads is conducted wrongly in that particular direction in which it diverges from the path of efficiency.

We know that you live under a competition so severe that only the most robust and aggressive contractor-dealer can survive. We know that the dealer is as necessary a part of the electrical trade as the manufacturer or the jobber in the sale of electrical merchandising appliances. And, with this knowledge set clearly before us, we propose to do our utmost to assist toward reconstructing the highway of business.

Where there is a rut, we'll get out of it; where there's a steep grade, we'll go around the mountain; where there's a chasm we'll bridge it; and where there's a long detour, we'll build a short cut.

Man Gets Business Who Goes After It.

On the other hand, there is no folly greater than to fool oneself; and it is folly to assume that the distributor has a vested right to any business. He must make his claim good by performances, and he cannot perform successfully without a clear knowledge of his powers and limitations.

The manufacturers and jobbers must first get the dealer's lively sympathy and then his active co-operation, and he must assist in creating a demand for electrical merchandising appliances and do all things which are vital and necessary to merit the business.

One of the principal criticisms of the manufacturer in the past has been that the average contractor-dealer does very little to create a demand for the sale of household and other electrical appliances to the consumer. In other words, he is not a merchant.

If the contractor-dealer will become a real merchant, there is no department of selling in which the manufacturer and jobber shall not be ready and anxious to help him, and suitable advertising matter will be furnished, salesmen instructed and attractive window displays suggested and the manufacturer, jobber, central station and contractor dealer go hand in hand down the road of business prosperity.

I believe it pertinent at this time to emphasize that the manufacturers believe that the electrical dealers have not been as active as they should be in the sale of motor-driven devices and there is a great possibility in this field.

Take, for instance, six of the commonest electrically operated machines used in the home—the washing machine, the sewing machine, the ironer, the vacuum cleaner, the fan motor and the polishing and grinding motor. All of these classes of apparatus have been developed to a high degree, are manufactured in very large quantities and should be used wherever electricity is available.

Specialty Agents Show Possibilities of These Sales.

The fact that the electrical dealers have overlooked this possibility is noticeable since a number of new concerns have sprung up which do nothing but handle devices of this kind, adding to their line a full line of heating apparatus. Such dealers can now be found doing a profitable business. Their stock in trade consists of an attractive display room in a district frequented by women on their shopping tours. These dealers usually do some advertising, and in some instances solicitation through the residence district.

The electric contractor-dealer has been slow to get into this particular field, and I believe that in order to handle devices of this kind he must have an attractive store, he must be in a position to do extensive solicitation, considerable newspaper advertising and render services from time to time in connection with such devices as he has sold.

It is true that either an attractive display room or else a system of house-to-house canvass and furnishing samples free of charge are necessary. Newspaper advertising has also been effective, if the advertisements are properly timed and

*Special Representative, Westinghouse Electric & Mfg. Company.

carefully prepared. The question of service is furthermore necessary, but the successful electrical dealers make their service feature one for building up additional business. In other words, their service men who go out to repair or adjust any device sold, open up sales for other classes of apparatus. They distribute literature and report prospects to the office, which are followed up systematically and energetically.

A good illustration of this service feature is that pursued by a concern out West which has recently put on the market a farm-lighting outfit. The sales organization of this company considers that it is just starting when it sells the farm-lighting outfit. It follows up the prospect with all sorts of electrical devices, such as fans, house pumps, washing machines, ironers, sewing machine motors and small motors for general power purposes. The prospect becomes a regular customer of lamps. He, undoubtedly will make extensions in time in his wiring and will require supplies. Thus, the organization becomes the sole supplier of the farmer's needs along electrical lines. If more of the electrical dealers would pursue such a policy as this they would, undoubtedly, build this business up enormously.

It would pay the electrical dealers to get in touch with the manufacturers of small motors and electrically operated devices used in the home. On the most expensive of these, extension time-payment plans are now worked out which enable the householder to finance purchases which he could not think of financing if it were necessary to raise the necessary cash.

The electrical dealer has not been alive to this situation in many localities. Manufacturers have had to establish their own branches for retailing these electrically driven devices, and as pointed out, a special class of dealer has sprung up simply because the electrical dealer has not realized the opportunity and modified his business methods to meet this new condition and established attractive retail stores.

Jobbers Planning Publicity Campaign

The Electrical Supply Jobbers Association of the United States is planning a national publicity campaign to urge upon the manufacturer and the contractor-dealer the importance of the intermediate position the jobber holds between these two extremes. There is still a marked inclination on the part of manufacturers to deal directly with the contractor-dealer and also a similar tendency on the part of the latter class to ignore the jobber, and the campaign now being arranged is calculated to convince both the manufacturer and the retailer that it would be to the benefit of each of them and in the interests of the electrical trade in every way if the jobber were to become formally recognized as a necessary "link" in the chain of distribution of electrical goods.

A report was presented at the recent Cleveland convention urging that such a publicity campaign be arranged for at once and pointing out the following advantages which should accrue as a result:

(1)—The removal from the minds of trade buyers, particularly those in the electrical trade, of the erroneous impression that the association does anything in the way of fixing resale prices.

(2)—Educating buyers of electrical merchandise to purchase of electrical jobbers rather than of hardware jobbers, drug houses or other concerns not strictly engaged in the electrical business.

(3)—Attracting the attention of manufacturers, especially new ones, to the service that members of the association

may render them as mediums of distribution and marketing of their products.

(4)—Impressing upon manufacturers the advantage to them of giving due consideration to the electrical jobbers regardless of what their sales policy may be.

(5)—Educating the buyer, especially those directly in the electrical business, to buy from the jobber rather than direct from the manufacturer and giving arguments in support of this.

(6)—Calling the attention of the buyer to the stocks carried by the jobbers and the geographical distribution of them, and consequent better service that may be given by a jobber than by a manufacturer, even on that manufacturer's own line.

(7)—Educating the buyer to the wide diversity of articles and lines carried in jobber's stocks.

(8)—Directing the attention of all readers of trade journals to the fact that everything that may be advertised in the particular issue he is reading can be purchased by him from a jobber.

(9)—Directing the attention of all readers of trade journals to the fact that the membership of the association undoubtedly includes one or more jobbers in his immediate locality who are prepared to render him a distinct service in furnishing goods advertised.

(10)—Directing the attention of manufacturers to the Electrical Supply Jobbers' Association as including the best jobbers in the country, and thereby quite likely influencing the manufacturers to refer to the fact in their own advertisements that their products may be secured from members of the Electrical Supply Jobbers' Association.

(11)—Making the buyer familiar with the enormous aggregate of dollars and cents value of the stocks carried as a whole by the Electrical Supply Jobbers' Association members as a demonstration of the service they can render.

(12)—Directing the attention of electrical jobbers throughout the country, both members and non-members, to the real objects of the association and to the educational work it is carrying on for the benefit of the trade.

(13)—Counteracting by dignified and businesslike arguments any tendency on the part of the government, the manufacturer, the contractor or any other interest to fail to accord to the jobber his rightful place in the industry.

(14)—Directing the attention of the manufacturer to the enormous purchasing power of the jobber.

(15)—Directing the attention of the manufacturer to the thoroughness with which the United States is covered by the activities of the jobber.

(16)—Proving to the manufacturer that the jobber actually creates business in addition to acting as an economic distributor of the material involved.

(17)—Proving to the manufacturer that the jobber can perform the functions of warehousing and distributing more efficiently and economically than the manufacturer can himself.

(18)—Directing the buyer's attention, particularly during war times, to the fact that to take advantage of jobber's stocks is one way of co-operating with the government, in that manufacturers are not loaded up with orders for material already in the jobber's warehouse.

(19)—Directing the attention of the buyer to the service rendered by the jobber's salesmen, a small part of which nowadays is the actual soliciting and taking of orders.

(20)—Directing the attention of the manufacturer to the economy of marketing his product through the jobber from the standpoint of accounting as well as from the standpoint of warehousing and distributing.

(21)—Creating in the minds of readers, especially those in the business, a proper realization of the jobbing business

as occupying its own essential and peculiar position in the industry, and thereby counteracting the belief on the part of many central stations, and practically all contractors, that all they have to do to become jobbers is to announce the fact, rather than have them realize that it is a field requiring peculiar fitness from every standpoint.

(22)—The building up of a spirit of good will on the part of buyers toward the jobber, a ready and prompt recognition of the service he is prepared to render, and a natural inclination to make use of that service.

A movement not unlike this is under way among Canadian jobbers of electrical goods. If the jobber can demonstrate to the manufacturer and the retailer that he is a necessary part of the machinery of distribution (and we believe he can), the present moment is opportune for such action. Whether or not more electrical goods are sold in 1919 than ever before depends upon our selling organizations.

Mapping Out the Appliance Market*

Three obstacles deter the average electrical merchant from making a useful census of his local electrical buyers. Let me list these in order:

1. Failure to study out logically the facts which it is desirable to know. Through fear of involving himself in too much system, the dealer is inclined to adopt a form of record which, when complete, amounts to little more than a list of names and addresses; or, if he has not a proper fear of red tape, he incorporates in his forms spaces for an array of facts either impossible to obtain or not essential to merchandising success.

2. Discouragement due to the size of the task. The dealer forgets that he presumably is established permanently and that a census of prospective customers—like the goodwill of his business—must be a matter of growth and not a thing which can be created overnight.

3. Failure to provide for keeping the census "alive." Any prospect list, even the simplest, is a never-ending job like—let us say—window cleaning.

The second and third obstacles can be overcome only by the grit and character of the individual. If a man is discouraged at the size of a job, no amount of coaxing is going to make him tackle it successfully. He is convinced in advance that it can't be done, which is the same thing as admitting himself beaten before he starts. And by the same token, if a man hasn't the innate stick-to-itiveness to maintain his census lists after they are once in working order, he hasn't the bulldog quality necessary to present-day business success. So we will dismiss these two obstacles and get down to the practical details of how to organize a useful sales prospect census.

What are the facts which it is desirable to know about a prospect?

The first thing, obviously, is the name, address and phone number.

Next we want to know something about his home. (The writer is speaking now specifically of residential prospects; industrial and commercial prospect lists can be built up upon similar groundwork, though the details, of course, will differ.)

In regard to the prospect's home, we wish to know, first, whether or not it is wired. Then, what class of home is it?—a cottage, a mansion, or a palace? How many rooms? Is it owned by the occupant or rented? How old is it; that is to say, does it seem probable that the owner will spend

money for improvements? What sort of neighborhood—one that is rising in value or one that is "going to seed"? Is there a barn or garage attached?

In regard to the prospect himself, we wish to know, first, to what station or class does he belong—workingman, office man, owner of a business, professional man (and what profession) or plutocrat? Size of family? What, approximately, is his net income? (Note the word net: a man who may be making \$5,000 and has to support six children and a platoon of his wife's relatives is not so good a prospect as a man whose family consists of a wife and a Pekinese canine.) Is the prospect a free spender, a careful man or a "tightwad"? Is he progressive or not? Does he drive a car—and how big? Approximately what are the ages of the children, if any?

After the prospect has become a customer, the information outlined does not by any means lose its value; on the contrary, it is necessary to know even more about a customer than about a mere prospect. This additional information includes: How does he pay—cash, prompt, dilatory or "dead beat"? Is he difficult or easy to sell? Is he easily satisfied, exacting or unreasonable? What electrical equipment has he already bought?

These are some of the facts that it may be desirable to have covering the electrical appliance purchasers of the dealer's territory. It rests with the individual dealer's judgment which of these facts are pertinent in his case and which are superfluous. He may have such familiarity with his town that he can visualize practically every building and know off-hand every necessary fact regarding each. Another dealer may have the sort of memory which enables him to keep the facts about his customers at his finger tips so that a card record of such information is mere time-wasting. This sort of memory is rare, however. Another may have an office assistant who is a veritable local "Who's Who" with all the gossip of the town on her tongue.

It rests, we repeat, with the individual dealer's judgment whether he will keep an exact, complete and painstaking census or a brief, concise mailing list. Mr. Doherty says, "The average man has no idea of analyzing his local selling prospects. He has no idea that he can make a census of the electrical buyers of his community." What he meant to say, the writer believes, is that the average man is too prone to take the easiest way. Because a job looks hard he either discreetly turns his back upon it or flim-flams himself into believing that an easy, inadequate solution of the problem "will do." So while we assert—because it is true—that the individual must decide for himself what scope his own census should cover, let us urge that no half-measures be adopted—that the proposition be faced honestly and fearlessly and solved according to cold fact, no matter how unpleasant and laborious the job may be.

Our own conception of a census card is one that visualizes the customer fully. When we pick up the record of John Smith, 18 Villa Road, we want to be able to see in our mind's eye a man who lives in a decent, ten-room house in a prosperous neighborhood, who drives a good car, who has three children from five to eleven years old, who is a careful spender but not an unreasonable customer, and whose electrical equipment consists of a flatiron, a sweeper, several good portables and a toaster. All this information can be contained on a small card; it can be collected and kept up to date with very little effort or expense, and it can be turned into cash sales. That, after all, is the thing we are after. If a census will help, start one.

The town of Ridgeville, Man., is negotiating with Mr. W. Post for a supply of electric light from a small isolated plant installed in his warehouse.

*By Frank B. Rae, Jr., in *Electrical Merchandising*.

How I Increased My Sales 100 Per Cent.

[The one need of the electrical business to-day is the man who can "sell more goods." There is no longer any question of the quality of electrical appliances, no doubt that they are splendid value for money received or that the story of their usefulness and convenience has never half been told, no fear but that the public will buy when they understand the situation. All that is needed is more sales. The manufacturer, in the main, is doing all he can, and is more or less helpless—so is the jobber. **It's up to the man who retails.**

Of course there are many wide-awake contractor-dealers who are increasing their business by rapid strides. There are others who are not. For this reason we have arranged to print a series of short snappy articles outlining a number of "stunts" that have been successfully used in business-getting. These articles will be entitled "How I Increased my Sales 100 Per Cent." They will be written by salesmen of undoubted ability and wide experience. Below is the first one. You will like it—and the next one will be better.—Editor.]

How I Increased my Sales 100 Per Cent.

How could I increase my volume of business? That was the question that had been forcing itself on my attention for months past. It wasn't that I was losing money

Discussed the new iron over the back yard fence

on the game or indeed that there wasn't a nice little profit coming in, but it was always plain to me that the field hadn't been well worked up. We just about took care of the business that came to us, and because we gave pretty fair service and tried to please and satisfy our customers our trade was getting bigger all the time. Still I felt that we weren't quite doing our duty to the public, to say nothing of the manufacturer. If No. 36 Southam Street bought an iron or a percolator or a toaster, then I said to myself, the same appliance is good for No. 34 and 38, No. 32, and No. 40 and so on.

This gave me an idea that has been the means of bring-

ing me in a good many sales and it worked very smoothly, as follows: Whenever we sold an appliance to Mrs. Jones, 25 Smith Street, we immediately consulted the directory and wrote a short letter to her neighbors living at No. 23 and No. 27. The letter ran something like this:

Dear Mrs. —

You will be interested in knowing that we are selling quite a number of our — irons on your street. Yesterday Mrs. Jones, your next door neighbor, bought one from us. There is no single item in the home that we know of that gives so much satisfaction and saves labor to such an extent as an electric iron. We shall be glad to have you drop in and see this iron demonstrated or, perhaps you'll have a chance to ask Mrs. Jones what she thinks of hers. If you'd like it we'll send you one on trial.

Yours faithfully,

J— W— & Company.

Well, it was surprising how many sales this scheme brought us in. Some women who were friendly with their neighbors would ask their opinions and buy accordingly. Others who were not on speaking terms would buy because they would not have their neighbors outdo them. On more than one occasion ladies have told me it was the means of getting much better acquainted with their neighbors, at which they were mutually pleased. No one resented the information being given out. What woman is not proud to have her neighbors know she has bought something?

This "stunt" worked better in some sections than others. It is not much use in the very wealthy districts, but rather among the medium-priced homes. On some streets it was the means of more than doubling my business last year. Next issue I'll tell you about another little scheme that worked wonders, too.

Who Said Service?

Two words in the English language that show unmistakable evidence of being worked to death are "co-operation" and "service." Yet one sees all too little evidence of the concrete things for which these words are the names. We deplore every day the lack of co-operation, and as for service, it is so rare that the few isolated examples of it are made the texts of long sermons. Service in fact is probably appreciated by all, attempted by a few and systematically practiced by—none. Here is an example in point, which by the way not only shows its importance, but that its omission, even in isolated cases, is apt to be a species of commercial suicide:

An electrical contractor-dealer was agent for a window light time clock and succeeded in placing one with a large firm in his district. A little later the key to wind the clock was lost and the customer applied to the dealer for a new one. The dealer said he would write to his principals at once. The customer inquired again in a few days and the dealer said he would write again. Finally, after several weeks delay, the customer wrote direct to the manufacturer and received his key in three days. The unfortunate sequel, although the natural one, is that the customer in acknowledging the prompt receipt of his key, suggested to the manufacturer that if he had a more reliable representative in this district he might do more business.

Now where the fault lay we do not, of course, know, but the customer is firmly of the opinion that the dealer was careless and indifferent. On the other hand this conclusion

may be wrong and the dealer may be able to explain the whole matter. It shows, however, the value of prompt service and the troubles constantly lurking around the corner for the man who even once fails to make good.

Cosy-Glow Radiators

The Westinghouse Company have added the "Cosy-glow" radiator, illustrated herewith, to their electrical appliance list. It is a substantially built appliance, mounted in searchlight

fashion so that it will throw heat in any direction. The heating unit, easily removable, is wound on a porcelain cylinder and is protected by a stout copper wire guard, which can be removed, when cleaning the reflector. The reflector, which aids in the proper spread of the heat rays, is built of polished copper, neatly finished.

Kingston's Electrical Men Public Spirited

Mr. H. W. Newman, recently elected mayor for Kingston, Ont., has been in the electrical business in that city for eleven years. He is a native of Kingston and has lived there all his life. He employs a staff of twenty men and during the war

Mr. W. H. Newman, Mayor of Kingston

did a great deal of work fitting out military barracks in the Third Military District. Mr. Newman has also carried out many other important government contracts, including the lighting of the Causeway between Kingston and Barriefield, and the lighting of several military hospitals. He has been a

member of the Kingston city council for five years, serving on all important committees. During the year 1918 he was chairman of the Health Committee and is regarded by many as the "father of daylight saving," having brought the matter before the Ontario Associated Boards of Trade and worked unceasingly to have the measure put through. He brought the matter before the local council and was successful in having a resolution passed in favor of it. In addition to being a successful administrator of civic affairs, Mr. Newman is also a thorough business man, always on the lookout for new ideas and possessed of the "pep" that makes the wheels go round. The city of Kingston is surely in very capable hands for the coming year.

Mr. James Halliday, who has just been elected by acclamation reeve of Portsmouth for a sixth term, and whose place of business is at the corner of King and Princess Streets,

Mr. James Halliday, Reeve of Portsmouth

Kingston, Ont., has been in the electrical business for twenty-five years. He made his start in the electric light plant at Gananoque, Ont., owned by Mr. J. M. Campbell, of Kingston. After serving there for some time he went to Kingston, taking a position with the Kingston Light, Heat and Power Company. Later on he became connected with the Kingston Street Railway Company and served this company for six and a half years as electrical superintendent. He left the railway company to go into business for himself and in the quarter of a century he has been thus engaged has made a splendid success of his business. He is wide-awake and up-to-date and his record is one that any man might well be proud of. He has taken a very keen interest in the village of Portsmouth, in which he resides, as can readily be seen by the results of the recent elections. He is also a member of the Frontenac County Council and in the year 1916 had the honor of being elected Warden.

On January 1st, the Canadian SKF Co., of Toronto, opened a sales office at 412 St. James Street W., Montreal, Que., under the direction of Mr. Geo. Sheppard, where they will carry a large stock of double row self-aligning ball bearings, single row ball bearings, automatic drill chucks, ball bearing hangers and pillow blocks and "Quality" steel balls. It is intended to give to Eastern users the best service possible in the matter of shipment and also to extend the SKF Engineering Service for ball bearing designs and applications.

Current News and Notes

Gravelbourg, Sask.

Mr. Samuel Chevrier, of Gravelbourg, Sask., is forming a company for the purpose of installing an electric light plant, with necessary distributing equipment, in that town.

Halifax, N. S.

A contract has been let for the construction of a new power house for the Halifax Shipyards, Limited, to cost about \$60,000.

Hawarden, Sask.

The town council of Harwarden, Sask., is negotiating with the Torgenson Garage Company with a view to granting this company a franchise to install and operate an electric lighting system.

London, Ont.

The Canadian Electric & Manufacturing Company, London, Ont., has sold out to the Western Ontario Electric Company.

The question of a municipal telephone system is receiving considerable discussion in London, Ont. Mayor C. R. Somerville inclines to the belief that government control of the Bell Telephone Company's rates would be more preferable although Mr. E. V. Buchanan, manager of the public utilities commission is quoted as saying that the matter of municipal telephones for the whole province, as well as London, is well worth a thorough investigation.

A report is current that the London & Lake Erie Railway may be taken over and operated by a new company. It is further stated that necessary improvements will be made to put the line on a parallel with other up-to-date electric railways and also that the tracks will be re-routed through St. Thomas so as not to run over the St. Thomas city lines as formerly.

Ottawa, Ont.

The ratepayers of Ottawa, Ont., voted on January 1, in favor of taking over the Ottawa Electric Railway in 1923, when the franchise expires, and operating it as a municipal enterprise.

Portage la Prairie, Man.

The question is again being raised of a transmission line from Winnipeg to Portage la Prairie, the estimated cost being in the neighborhood of \$375,000. The matter will come before the local legislature at the next session.

St. Boniface, Man.

The building of a new telephone exchange building for the Government telephones at St. Boniface, Man., is likely to be proceeded with in the spring. This project was held up by the war.

Toronto, Ont.

Wage increases ranging from eight and a-half per cent. to eleven and a-half per cent, have been granted to electricians and linemen of the Electrical Workers' Union, employed on the Toronto Hydro-electric System.

Passengers carried by the Toronto Street Railway in 1918 numbered 166,000,000. The gross income was \$6,618,000 and the city's share amounted to \$1,300,000. The increase in passengers carried, over 1917, amounts to 8,000,000.

Toronto's street lighting will, it is said, be on a "peace basis" by March 1. There are some 15,000 lamps to be re-lighted.

The revenue of the Toronto civic car lines during 1918

amounted to \$331,896, as compared with \$278,147 in 1917. The estimated cost of operation was \$325,879; debt charges amount to \$171,064, which, after allowing \$1,500 revenue from advertising privileges, leaves a deficit of \$163,547.

Trenton, Ont.

A 44,000 volt transmission line is being erected from Trenton to Picton, Ont., by the Hydro-electric Power Commission. It is expected this line will be completed by the end of January. An out-door type sub-station is being erected at Picton and power will be turned on some time in February.

Wellington, Ont.

The municipality of Wellington, Ont., has purchased the local distribution system of the Nyles Seed Company and will secure a supply of power from the Hydro-electric Power Commission. An out-door type sub-station is being erected at this place which will also supply the town of Bloomfield.

Winnipeg, Man.

The Canadian Pacific Railway telegraph office, Winnipeg, is being moved from the present location at the corner of Portage Avenue and Main Street to a building a few doors north. It is estimated the work will cost in the neighborhood of \$50,000.

Personals

Mr. Kenneth J. Dunstan, division manager Bell Telephone Company, has been elected president of the Toronto Board of Trade. Mr. Dunstan is one of the best known electrical men and one of the most active, both in his own sphere and outside it, in the province, and his election to this office, which was unanimous, shows that all Toronto business men alike hold him in the highest esteem.

Mr. E. F. Seixas, who for the past nineteen years has been general manager of the Niagara, St. Catharines & Toronto Railway, has been appointed general manager of the Monterey Railway, Light, Heat & Power Co., at Monterey, Mexico.

Mr. Edward McGivern, master mechanic on the Chippewa development of the Ontario Hydro, has resigned to accept a position as superintendent of works on section two, Welland Ship Canal.

Mr. H. H. Couzens, general manager Toronto Hydro-electric System, has been elected a Board of Trade representative on the Canadian National Exhibition Board.

Mr. Geo. H. Olney has resumed his old position as managing director of The Eugene F. Phillips Electrical Works, Limited., Montreal.

Obituary

James A. Collie, pioneer telegraph operator, died recently in Montreal. He started with the G. N. W., in 1885, transferred to the C. P. R., in August, 1886, a month after that company opened its commercial wires to the public and had been in continuous service since then.

Mr. V. I. Smart, formerly Professor of Railway Engineering and Transportation, McGill University, and Mr. J. A. Burnett, formerly electrical engineer, Grand Trunk Railway System, are now associated as consulting engineers, located at 821 New Birks Building, Montreal. The lines handled will be civil, electrical and mechanical engineering.

Letting the Flashlights Sell Themselves

A small dealer on a side street devised a very original way of calling attention to his flashlights. His store was long and narrow and the street outside was poorly lighted. In the rear of the store (which was visible from the window front) the dealer rigged up three flashlights which he operated from separate toy transformers instead of the usual batteries. Each transformer was put in circuit with a flasher, timed so that no two were on at the same time.

At night, after business hours, the store was left totally dark except for the intermittent gleam of the flashlights. Each light illuminated a sign. One sign read:

Here It Is!

The Flashlight locates things quickly.

Another sign read:

Stop in and get a Flashlight
on the way by tomorrow morning—

Price \$1.00.

We open at 8 o'clock.

The third sign read:

Drop your name and address through the letter-slot—We will mail you a flashlight C. O. D. Price \$1.00.

—Electrical Merchandising.

B. R. T. in Receiver's Hands

Ex-Secretary of War Lindley M. Garrison, has been appointed temporary receiver of the Brooklyn Rapid Transit Railroad Company, the New York Municipal Railroad Corporation, and the New York Consolidated Railroad Corporation, these two being subsidiaries of the Brooklyn Rapid Transit Company. The companies did not oppose the action, for they felt that they would be subverted by a temporary receivership.—Electric Railway Journal.

NEW AND USED MACHINERY

A Continent-wide Service

Concluding a year of Achievement

America's splendid industrial achievements in the memorable year of 1918 were possible through the sound judgment displayed in so systematizing production as to conserve needed materials and to effect economies in operating and maintenance

ECONOMY Renewable FUSES

have played a noteworthy part by protecting vitally important electrical circuits of the U. S. Navy, the leading steel and powder mills and thousands of representative plants in all branches of industry against the fire and accident hazards of overloads and short circuits. It was due, in part, to their accurate rating and all-round efficiency that the wheels were kept turning with safety.

They have directly saved millions of dollars for their thousands of users because they cut annual fuse maintenance costs 80 per cent. as compared with the use of "One-Time" fuses.

We now face the great reconstruction period. Conservation and economy must be practiced more extensively and constructively than ever before. Economy Fuses are essentials as factors of practical economy and conservation.

"PITTSBURGH"

The Scientific Show Window Reflector

Illustration shows "Pittsburgh" Reflector No. 100, for 100 or 150 Watt Lamp. Dimensions: Height 8 inches, width 8½ inches, holder 2¼ in. Form "O."

It redirects and controls the light to give the greatest possible illumination to the object. The "Pittsburgh" Reflectors, by scientific construction and test

give the maximum result from your lighting, and will pay for their small cost in saving of current. Don't fail to write for our folder on lighting efficiency.

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

Spaulding HARD FIBRE

Look over the article you manufacture carefully—study its blue prints and specifications. You too may find that Spaulding Hard Fibre will save you money or improve your product. With its electro rupture of 200-400 volts per 1/1000 in. of thickness; Tensile strength 10,000-20,000 lbs. per sq. inch; compressing point 9,000-13,000 lbs. per sq. in., Spaulding Hard Fibre is rapidly replacing iron, steel, brass, copper, wood, hard rubber, porcelain, leather, raw-hide, and other materials.

**Let us tell you where you can use it
in your product.**

The Choice of the Largest Canadian Jobbers

EVERY really large and reputable jobbing house spends time and money making thorough investigation of a line before handling it. Investigations in the lamp field have prompted the largest jobbing houses in Canada to select from a world-wide market Laco Lamps. Not only that, but they have been handling Laco Lamps for years with a continued increase in sales year after year.

The Following Jobbers Handle Laco Lamps :

*It's a Representative List
of Canada's Leaders*

John Starr, Son & Co., Ltd.
Halifax, N.S.

Eastern Electric Co.
St. John, N.B.

**Canadian Fairbanks-Morse
Co., Limited**
Montreal, Toronto, Winnipeg, Vancouver

**Canadian H. W. Johns-
Manville Co., Limited**
Montreal, Toronto, Winnipeg

Munderloh & Co.
Montreal

Great West Electric Co., Ltd.
Winnipeg, Man.

Rankin & Cherrill
Vancouver, B.C.

E. B. Horsman & Son
Vancouver, B.C.

W. H. Hazlitt Co., Limited
Vancouver, B.C.

LACO

LAMPS

WE take keen pride in the fact that these jobbers continue to recommend Laco Lamps to their dealer customers—and remember, Mr. Retailer: When these firms feel justified in backing the sale of LACO LAMPS with their reputation and their capital—it is good business for you to follow that lead and put in a stock of these successful business-getters.

Laco Lamps are well advertised from Coast to Coast.

We are creating a demand that will be very profitable to you. Co-operate with us in meeting it. The LACO Sign in your store is a prestige-earner and trade-builder.

Booklets, folders, window cards, hangers, window trims, etc., will be furnished for your store. If you have a large prospect to close we will gladly send one of our specialists to help you—without cost, of course.

Laco Lamps offer one of the best propositions on the market. Write to-day for details

ESTABLISHED 1849
BRADSTREET'S
Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating informa-
tion no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

the
Possibilities
of**

Spaulding HARD FIBRE

Look over the article you manufacture carefully—study its blue prints and specifications. You too may find that Spaulding Hard Fibre will save you money or improve your product. With its electro rupture of 200-400 volts per 1/1000 in. of thickness; Tensile strength 9,000-13,000 lbs. per sq. in., Spaulding Hard Fibre is rapidly replacing iron, steel, brass, copper, wood, hard rubber, porcelain, leather, raw-hide, and other materials.

**Let us tell you where you can use it
in your product.**

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

**This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission
They use it for
STREET LIGHTING**

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Nights
Beach
1723 1930

Creeping softly out from his warm winter bed, "Brer Groundhog" will come one day this month.

If he sees his shadow, then six weeks more of Jack Frost. If the sun is hidden, and no "Amelite" in view, then prepare for spring.

But in either case there will be brighter business, bigger profits and steadier sales for every merchant handling the "Amelite."

FORECAST: New business, prestige and prosperity comes with the "Amelite."

"Coming events cast their shadows before."

The far-sighted Electrical Merchant is finding a ready market for the "Amelite." It is speeding his sales and building future business for him.

The **Amelite**

meets the demands of the times: exceptional lighting efficiency, moderate cost, easily installed.

The "Amelite" is the Thrift Light of the country. It makes old stores new, new stores brighter. Easily kept spotless, efficient and clean.

Sales are waiting for you in your town.

Write for prices to-day. Get business with the "Amelite."

FRED THOMSON CO., LIMITED

7-13 ST. GENEVIEVE STREET

MONTREAL

We extend a cordial invitation to the electrical fraternity to call upon us in our new building—the largest and best equipped electrical repair establishment in Canada.

Here's A Better Way-

AND by "better" we mean safer, cheaper and more flexible in application.

On inside station switching, where it is necessary to have quick means of disconnecting, and particularly interconnecting, transformers, regulators, etc., the G & W disconnecting pothead illustrated above has proved itself a more direct, more flexible and more fool-proof means of accomplishing such operations than the cumbersome method of employing disconnecting switches, specially built switchboard, very limited as well as "round-about" in operation.

Installations utilizing this "Better Way" have proven uniformly successful. Our engineers can work with you in applying it effectively to **your** inside switching requirements.

Ask for complete information.

Iron Box Bells, Buzzers and Annunciators

No. 91
San-Fer-Ann Annunciator

Open View
San-Fer-Ann Annunciator

San-Fer-Ann Annunciator

A high class gravity drop annunciator, with white enamel steel case. Drop openings are fitted with glass. Steel case is hinged to back board on one side and slot to accommodate screw is cut on the other

side. The bell has pure silver contact points. Throughout the annunciator, no rubber is used for insulation. The price is only slightly higher than wood case annunciators.

Some Exclusive Features of Edwards Bells

Fahnestock Clips:

For connecting wires, instead of old screw terminals. Saves time and eliminates loose connections.

Gong:

Riveted to support to prevent removal or turning.

Cover:

Held in position at three points.

Hammer Rod, Ball and Armature:

One piece swagged to present bending in operation. Hammer ball operates inside of gong.

Pivot:

At centre of balance to prevent strain.

Dust and Bug Proof:

Pivot is located at nearest possible point to the cover where there is practically no motion. The opening is only slightly larger than the rod which passes through it, leaving no room for foreign matter to enter.

Finish:

Black enamel, nickel trimmings.

Our house nearest you will be glad to supply complete Edwards Catalogue and information upon request.

Buss Fuses

ELECTRICITY'S SAFETY VALVE

Poured Into the Electrical
Users' World During 1918.

In less than four years, the sale of BUSS Fuses has increased
from 291,767 to 9,000,000.

3600% Increase in Four Years

is conclusive evidence of the superiority of mechanical design
and supremacy of quality of BUSS Fuses. Note these figures:

1915 Buss Fuses Sold	-	-	291,767
1916	-	-	1,325,538
1917	-	-	4,650,297
1918	-	-	over 9,000,000

What will 1919 bring?

We have set our mark to over 18,000,000. Our increasing
facilities and scientific production will be equal to the task.
Strict confinement to our high standard of quality will assure
the attainment of our goal.

*BUSS Fuses are furnished in all types
of renewable and non-renewable.*

NATIONAL PRODUCTS

FLEXTUBE

We cannot tell you *all* about *all* National Products in this limited space, but we do want to call your especial attention to certain features of **FLEXTUBE** Non-Metallic Flexible Conduit.

It's the **original** seamless interwoven non-collapsible non-metallic flexible conduit with the "rollerbearing" interior. There's absolutely no waste; every foot of every coil can be used, and it's so easy to fish that it's a pleasure for the wiremen to use. That makes it profitable for the contractor, and its quality is such that the best interests of the owners are served. Note the construction. The seamless interwoven tubing compounded; then the protecting outer braid, also compounded—a double compounded tubing which is satisfying to those who insist upon the highest quality. Place your order for your requirements with your jobber; specify by name—**FLEXTUBE**.

The Meter of Merit

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Quality First

Fundamental Principles

A motor requires a certain number of WATTS for a given effort and is rated for certain VOLTS.

$$\text{Watts} = \text{Volts} \times \text{Amperes}$$

If the VOLTS drop below motor rating the AMPERES must increase.

The motor pulls its full load and reaches its best speed only at rated VOLTS.

When the motor draws excessive AMPERES (as it does at low VOLTS) it overheats. Burnt-out armatures naturally result.

Now good bonding delivers the largest percentage of the power house VOLTS to the motor, with these results:—

1. Maximum motor capacity and speed.
2. Minimum motor troubles.
3. Saving in power.

So good bonding is a paying investment.

O-B Bonds are good Bonds.

REFILLABLE FUSE PLUGS

***“Used with
Arcarest
Refills”***

THE CLEMENS' ELECTRICAL CORP.
OF CANADA, LTD.

KING WILLIAM & FERGUSON AVE

Hamilton

Canada

J. C. REFILLABLE FUSE PLUGS have been developed to fill a demand for a refillable Fuse of the Plug type which would be simple in construction, simple to refill, serviceable, and saving in costs.

Standard Fuse Plugs when burnt out are thrown away, or scrapped, which is wasteful and expensive, especially in these days of conservation.

J. C. REFILLABLE FUSE PLUGS save this waste and expense, as when they burn out they can be refilled, and refilled twenty to thirty times, at a cost of 1c each.

Our Arcarest Refills are simple in design, and require no tools to insert them in Plugs.

THE J. C. REFILLABLE FUSE PLUGS stand highest in protection, service, and saving, and are manufactured to conform with the National Electric Code Standard dimensions.

J. C. REFILLABLE FUSE PLUGS are guaranteed to give perfect satisfaction.

J. C. REFILLABLE FUSE PLUGS are used mainly in Industrial Plants, Office Buildings, Hotels, Railways, and other large users of Fuse Plugs. Also operating Companies are particularly interested in them, as it enables them to reduce the Capital tied up in carrying a large varied stock of Fuses. By using our Arcarest Refills it is very convenient to change to any capacity required.

J. C. REFILLABLE FUSE PLUGS are interchangeable to any capacity from 6 to 30 amperes.

ARC WELDING—RAIL BONDING

ERICO PORTABLE RHEOSTAT constitutes a complete arc welding set which can be used in shop or along track, wherever the power line runs, for general arc welding purposes such as joining frame members, building up worn axles, mending leaky pipe lines, and repairing worn key ways in armature shafts as well as broken parts.

Furthermore, when used with the ERICO PORTABLE WELDER the most efficient and durable rail bond on the market can be installed with an ease and speed that are unrivaled. The rheostat weighs 140 lbs., the welder 65 lbs. No trouble in clearing traffic.

The Nameplate Which Helps Make the Sale

The R&M Fan advertising, which has been running in the leading magazines for more than a decade, has taught the general public the significance of R&M Quality.

When the discerning fan buyer looks at the name plate on the fan, and finds there, the name "Robbins and Myers", he knows that the fan is a quality product—one which is guaranteed to give absolute satisfaction. The dealer's sale is well on the way towards realization.

Low selling costs and satisfied customers are insured the dealer who connects up with R&M Fan quality and R&M Advertising.

To enable R&M Fan dealers to identify themselves with R&M magazine advertising we are prepared to supply a complete line of free advertising matter for local use over the dealer's name. This material is described in a folder, just off the press. If you haven't received a copy, write for one.

No. 4

Ontario Electrical Men Prepare to Practice the Goodwin Policy

W. L. Goodwin gave the electrical men of Ontario province a new vision on January 30 and 31, when he visited Toronto and addressed, at different times, gatherings of municipal engineers, manufacturers, jobbers and contractor-dealers. The engineers started it with their semi-annual convention by inviting Mr. Goodwin to be present on Friday morning and explain in detail his plan of organization. The manufacturers and jobbers took advantage of the opportunity to secure him for Friday afternoon and in the evening he met the contractor-dealers and gave them such a heart-to-heart talk as will continue to bear fruit for many days to come.

There is one fact that now stands out more prominently as the result of Mr. Goodwin's visit—the aim of every branch of the electrical industry is the same; every one in it, the central station, the manufacturer, the jobber and the contractor-dealer are working for the same goal—bigger sales of electrical goods. In the past the manufacturer has been inclined to say to the jobber and the jobber to the retailer—"Where would you be if it were not for us?" The dealer and jobber respectively replied: "And where would **you** be if it were not for **us**?" Mr. Goodwin offers a new viewpoint—"Where would any of us be if it were not for all of us?" In so doing he demonstrates that the interests of all are intimately bound up together. The space previously looked upon as a sparring "ring" he transforms into a round table

of get-together discussions. Closer contact shows each that the "other fellow," so long considered a knave and a rascal, is really an honest man, and with the realization of this fact our suspicions disappear, our common sense gets the better of our prejudices and our imaginary feelings of diversified and opponent aims vanish into thin mist.

It may be too early to state definitely that the Goodwin plan of organization is actually applied in Canada to-day as the result of Mr. Goodwin's propaganda work, but we believe we are quite within the mark in saying that the various elements in the trade are more nearly in synchronism than they have ever been before. And, by the way, that word synchronism was used to good effect by Mr. Goodwin in paralleling the relationship between the various "machines" in the electrical industry and the various machines in a power house when he pointed to the inefficient results if electric generators do not properly synchronize, which is no worse than the chaotic state of the whole industry to-day as the result of a lack of general co-operation.

The manufacturers are well on the way to organization; so are the jobbers. The contractor-dealers are already prepared. Regarding the central station situation, there is the Canadian Electrical Association and the Association of Municipal Electrical Engineers. The latter organization practically committed itself to support the scheme, but so far as we know the matter has not as yet been discussed before the private companies. This would seem to be a step for the very near future, for no plan of general co-operation can be a real success unless everybody joins in. The general plan, as it will likely work out finally, calls for representatives chosen from every organization or association covering a distinct field, in the industry. These representatives would meet as a joint executive to discuss all points at issue between the various sections and reach an amicable understanding. It is thus evident that nothing less than a full representation could really bring about co-operation and co-ordination in fact.

Clearing Houses Also Needed for Technical Men

The Canadian Government is establishing employment bureaus all over Canada—some 65 in all—which will, in effect, act as clearing houses where employers requiring labor and laborers looking for employment may get in touch with one another. Apparently, however, the scheme was not designed for any particular class, or perhaps it would be nearer the fact to say it was only designed for one class, namely, the laborer, who, on account of his greater numbers and his natural limitations for getting in touch with any employment except that nearest to hand, naturally will monopolize the government's efforts. Yet there are other classes of returned men for which it is just as essential that provision be made. Indeed insofar as the development work of the country is concerned it is of the very greatest importance that men of constructive ability should be utilized as soon as possible, as their work must necessarily precede that of the mechanical trades. For this reason it is urgent that engineers and technical men, men with construction experience or who have held positions which developed organization ability, should be given congenial employment the very moment they are discharged from military service. Aside from the fact, of course, that the members of the mechanical trade must be fed and clothed their employment necessarily follows by a few weeks, or months, as the case may be, the employment of the man with technical or organization training.

One cannot but realize that the plan of the government is incomplete so far as the professional man is concerned.

We understand that representations are being made in the proper quarters to have the weak points in the plan strengthened up. The proposals will no doubt take cognizance of the fact that the technical man is not quite so local in his activities, which will make it less necessary to have the offices close together—probably one or two in each province will be sufficient. These, doubtless, should be in charge of technical men who have been overseas. The immediate work of these officials would seem to be the obtaining of a list of positions vacant from municipalities, private corporations, and others requiring the services of technical men, and a compilation of the experience, technical training, record, etc., of the men whose services are at disposal.

It must be remembered, however, that the success of any such scheme as this is dependent upon the demand for men being equal to the supply. At the present moment this does not appear to be the case. The government has said definitely "We will see that there is no unemployment." So far they have not lived up to this promise and the establishment of employment bureaus when there is no employment is not a solution.

Electric Club of Toronto Hold Record Meetings

Sir Robert Falconer, president of the University of Toronto, addressed the Electric Club of Toronto at their luncheon on Friday, January, 24th, on the subject: "Educational Adjustments Resulting from the War." Sir Robert emphasized the necessity of correcting the error existing in the average mind that the education of the future will be materially different from that in the past. He pointed out that idealism has existed to a very marked degree in the teaching of scientists and educationalists long before the war and that the only change we could hope for would be a purer atmosphere and in general more favorable conditions which would make it possible now for the first time to convert our ideals into realities. Sir Robert compared the German ideal with those of the nations at war with her. One was a subservience of the rights and liberties of the individual that the nation, as a unit, might be efficient. The other worked for the same efficiency through the development of each individual. The first idea represented individual slavery; the second individual freedom. It was for this we have fought for four years, and it is this personal freedom that will now make possible a more perfect application and realization of the worth-while things in life.

The speaker outlined briefly the general lines along which he considered education should proceed. The idea that a university training was for any particular class of stratum of society was entirely wrong. On the other hand such education as our universities give would be unfit and unwise for all. The training of each individual should be such that he would be enabled to make the best use of his natural gifts so that in the aggregate the nation would be applying their ability at maximum efficiency. This would mean the highest national efficiency—an efficiency quite as great as the German ideal and based on an infinitely more permanent and more human foundation.

Sir Robert closed with an appeal for the more generous recognition of the financial needs of education. We readily provide money for the establishment of industries from which we do not hope to receive dividends for many years to come. Surely we should not be less generous in the development of our young men and women upon whom the future of our national success so absolutely depends.

The largest attendance in the history of the club greeted Dr. F. B. Jewett, at the February 7 luncheon, when the distinguished guest described some recent developments in "Wireless Telegraphy." Dr. Jewett is director of the Research Branch of the Bell Telephone System and Chief En-

gineer of the Western Electric Company, and has played a most important part in the development of wireless communication for war purposes. Dr. Jewett described the earlier experiments resulting finally in connecting this continent with Europe. For the last two years, however, all the energies of his laboratory had been devoted to the application of wireless to aviation, and naval operation and control. The final result is that aviators are now able to communicate with one another and with ground stations, and naval operations have been tremendously simplified. In the search for submarines wireless had proven particularly effective. In our next issue a more complete report of Dr. Jewett's address will be given.

Montreal Electric Club Also Very Active

Mr. H. T. Meldrum, who was for three years connected with the C. P. R. War Office Purchasing Agency in London, spoke on "Trade Opportunities," at the Montreal Electrical Luncheon, on January 15th. He remarked that up to 1914 our manufacturers were not widely known abroad, but that today a new policy was forced on the manufacturers and they were taking up this policy with a vigor and hopefulness that would not have been expected of them four years ago. Mr. Meldrum expected a considerable business to come to Canada during the reconstruction period, but at the same time believed there would be a certain amount of delay in the placing of actual contracts.

It would, he said, probably be months before a scheme of rebuilding Europe on a permanent basis was arranged for; when that business came it would be on a large scale, as enormous quantities of supplies of all kinds would be required. In the meantime manufacturers should prepare themselves by ascertaining the types of material which will be required and by making arrangements for the consolidation of forces in order to take charge of big contracts. In his opinion, Europe would not be a permanent field for Canadian manufactured exports, basing his opinion on the fact that advanced tariff schedules would come into operation which would not be advantageous to Canada. He therefore looked to other parts of the world as offering more attractive permanent fields for Canadian manufactured goods. In this classification he would include Asia, Africa and South America. Let Canadian firms go after this business as fast as shipping readjustment would permit; it would be a strong basis for a permanent trade. By getting in when there was great need and selling honest goods at an honest price Canada could establish a reputation which would stand her in good stead when competition again became keen. Her increased production would cheapen the output to the point where she could meet the manufacturers of other countries with a more or less even chance. While Canada was handicapped in respect to high cost of labor and climatic conditions, she was in a splendid position as regards the supply of certain essential raw materials, in immense power developments, in a strong aggressive population, and the advantage of a climate that kept the vitality of the people at a high pitch.

In addressing the Montreal Electrical Luncheon on January 22nd, on "Drafts for the Front," Major Geo. G. Mitchell described the work of transporting troops between England and France, particularly in relation to the drafts sent across from time to time to keep up the strength in the front line trenches. The speaker gave particulars of the activities following upon orders from the front to send a large draft to some unit in France. He stated that the closest examination possible was made of the men who composed the draft. It was true that the red tape involved much work, but it was necessary to produce a fit soldier for the front line. Major Mitchell also described the send-off given

soldiers embarking at Southampton, and their arrival at the base, and later the front line.

"National Research" was the subject of a talk by Mr. W. B. Campbell, at the Montreal Electrical Luncheon, on January 29. After pointing out how the world had benefited from scientific and industrial research, Mr. Campbell remarked that the three essentials for efficient research work was a good library, apparatus, and suitable men. He urged in favor of a central laboratory, instead of a number of small units.

To establish this all the existing government laboratories should be combined into one large laboratory. This had been suggested before now, but the suggestion had met with opposition from the departments concerned. The opposition was based chiefly on the rather intense jealousy which existed between some of the departments, particularly those whose work was liable to overlap. They reasoned that, if all laboratories were combined, the work of some would be credited to others, and that there would be a danger of more money being granted for some work than was given for other equally important work. This difficulty would be avoided if the decision as to the extent of any investigation, and the money expended for it, be left, as at present, under the supervision of the departments concerned. Each government branch or department which felt that research should be conducted on some subject under its jurisdiction, would allot a suitable sum for the work. This would be expended by the laboratory to the best advantage, and the results would be the property of the department or branch to be used as they saw fit. Progress reports would go to the department at frequent intervals, so that it might keep in touch with the work. The personnel employed would be under the sole supervision of the laboratory, and would to this extent be removed from political patronage.

Major Ward, a Canadian who lived in England for ten years, and who described himself as a parson in disguise, was the speaker at the Montreal Electrical Luncheon, on February 5. In a talk full of racy incidents, he pictured the life of a Tommy from the time of his enlistment until he reached the front. The discomforts, to use a very mild term, of the trenches—sewers, Major Ward called many of them—were described; the necessity which compelled men to sleep in water soaked clothes and under very exacting conditions, and how men had to shave with tea and even with soup, was graphically pictured by the speaker. The ordinary Tommy, he said, practically lost all sense of responsibility; and many of the wounded men, who had all possible hospitality lavished on them in England, were apt to contrast their treatment in Canada, where they, of course, drifted back to their homes, although much was being done for returned men in this country.

Major Ward made a forceful appeal for consideration for returned men, many of whom had not yet regained their normal condition. Their services at the front deserved forbearance on the part of those who had not shared in the fighting, and he asked for patience in dealing with the men.

Turning aside for an evening from the perplexities of the electrical industry, the members of the Montreal Electrical Luncheon and their friends held high festival at a smoking concert at the Windsor Hotel on February 6. The Ladies Ordinary was filled to overflowing, and a right merry time was enjoyed, Mr. W. H. Winter presided. The programme was arranged by the entertainment committee—Messrs. Dwight Smith (chairman), J. W. Pilcher, and E. Sayer. It was full of good things, one of the items which appealed to the audience being the boxing bouts arranged by Billy Armstrong, who also staged a very farcical exhibition of the noble art. In the interval there was abundance of refreshments. The whole proceedings were naturally of the free

and easy description, and a fine entertainment concluded about midnight. During the evening Mr. Winter announced that the average attendance at the luncheons was increasing, and had gone up from 56 in 1917 to 58 in 1918, and to 61 during the present season.

The following is the programme:—First spasm, pipes and drums, Sgt. McKinnon and Sgt. Gordie Davis, 42nd Batt.; patriotic song, Mr. Jas. Poole; selection from Dr. Drummond's Poems, Mr. Turner; comic song, Mr. Bert Mason; tenor solo, Mr. T. Bissett; monologue, Witty Warren. Second spasm, drum solo, Sgt. Gordie Davis, 42nd Batt.; 3 round boxing bouts, members of M.A.A.A.; Scotch ballads, Mr. James Poole; monologue, Trooper Brown; cello, solo "Priere," Sgt. Denton; songs of the day, Mr. Bert Mason; funny sayings, Witty Warren; recitation, Mr. Turner.

Toronto Section A.I.E.E. Discuss Manufacture of Porcelain

It is possible that Omar Khayyam, in the market place, as he "watched the potter thumbing his wet clay," received some insight into the manufacture of porcelain, but he would have obtained a better working knowledge of the subject if he had lived long enough to hear the paper which was read by Mr. Hugo J. Lundgren of Peterboro to the Toronto section of the A. I. E. E. last week. Not only did the author treat of the electrical applications of the material, but he gave a summary of the development of porcelain manufacture in general. In the great scheme of the universe it was not intended that Canada should be an insulator manufacturing country, for the great glacial slides carried all sedimentary deposits, including the valuable china clay, down into the States. However the glaciers failed to clean out a rock pocket in the Province of Quebec which is now the chief source of the mineral in the Dominion. The other ingredient of electrical porcelain, namely, feldspar, is very abundant in Canada.

Both the wet and the dry process are employed for making insulator porcelain, but the former is most in use for high tension material. Elements for suspension insulators and similar parts required in quantity are moulded in steel dies in a press with special precautions to prevent the clay sticking to the mould. A few years ago a record was achieved by an insulator which took a puncture test of 15,000 volts, the insulator being one of the same size and shape as that used on telegraph lines. To-day, twenty-five years later, with the same raw materials a porcelain is made which will stand a test of 15,000 volts per millimetre. Above seven mm. the dielectric strength becomes less. A greater proportion of feldspar will increase the dielectric stress, but usually at the expense of the physical properties. Under ideal loading conditions the compressive strength might be taken at 8,000 lbs. per sq. in. and the tensile strength 24,000 lbs. per sq. in., but such conditions are very difficult to realize in practice. Insulators are largely subject to unbalanced strains which makes their virtual strength much lower than tests would indicate. The hardness of electrical porcelain is 7 on Mohi's scale and its specific gravity about 2.4.

Annual Meeting of the J.C.T.O.

The annual meeting of the Joint Committee of Technical Organizations will be held on March 24. The place of meeting will, probably be the Chemistry and Mining Building of the University of Toronto, but a definite statement will be made later. It is announced that the addresses this year will be given over almost entirely to a discussion of various phases of the labor situation as it affects the electrical industry.

Ontario Municipal Electrical Engineers Celebrate their First Anniversary

A Vigorous Organization of Keen, Aggressive Men

The Association of Municipal Electrical Engineers of Ontario, which celebrated its first anniversary, in Toronto, on January 30-31, has all the earmarks of a thriving organization. There were some 120 members present, all of them enthusiastic, and the discussions were characterized by unusual "pep" and unanimity. The association was particularly fortunate in having Mr. W. L. Goodwin present and in hearing from his own lips the explanation of the "Goodwin Plan" for the improvement of the electrical industry, and it seemed that the municipal engineers of Ontario were won over to the co-operative idea, illustrated in the analogy of the Wheatstone Bridge, just as whole-heartedly as have other electrical organizations all over the continent.

The first session of the convention was held on Thursday morning, in the Chemistry and Mining building of the University of Toronto, the president, Mr. E. V. Buchanan, of London, in the chair. In his presidential address, Mr. Buchanan said in part:

This is the first anniversary of the A.M.E.E. of Ontario and we have every reason to celebrate. Everyone grants that the convention at Niagara Falls was a success, and this meeting gives every indication of being equally successful. I am very optimistic. I have visions of every city in Canada having a municipal electric plant in the near future and then there will be an organization extending from coast to coast. It is natural that on an anniversary or at the beginning of a new year one should look into the future and make resolutions. Our resolutions should be based on the ideal we have gained in the war and which we must apply to the reconstruction period. The war has taught the least discerning what may be accomplished when all elements work together for common good. The individual members of the association should keep before their eyes the good of the association; the association should work for the good of the province and the dominion, by the development of electrical science. What science in this present day can do more for

national prosperity? Electricity is the greatest factor in commercial prosperity, but it is also one of the greatest factors for human contentment, without which commercial prosperity is worthless.

In the next year or two a greatly increased power supply will be available. It is our duty to find a market for this power, and here again let me give expression to my optimism, by telling you that it is an easy task we have, although, like any other task it may be done well or badly. It is just as imperative that we should do our bit now as in wartime.

Hydro assuredly had its war burdens, but no observer can escape the conclusion that it has gained more public recognition of its service potentiality than would have been possible in a decade of normal conditions. The people will not forget the great importance of Hydro to our communities and to the Dominion. It seems therefore that we have gained a good deal out of the circumstances of the war, even if temporarily the burdens were heavy.

With these few abstract observations in mind I would call your attention to the programme submitted by the papers committee. Merchandising policies are featured prominently, as naturally they should be at a time such as the present; better methods of construction are given consideration in the discussion of bare and covered wire for distribution, while the technical is not forgotten as an interesting talk and demonstration on the oscillograph is to be provided.

The secretary then read a letter from Mr. W. B. Johnson, of the Montreal Light, Heat and Power Co., regretting that he was unable to be present to give personal attention to his paper and suggesting that Mr. E. H. Porte, manager, Renfrew Electric Co., act in his stead. Mr. Porte kindly consenting, the president announced the subject of Mr. Johnson's paper as "The Advisability of Electric Companies Handling Appliances and Supplies and Maintaining Standard Prices as established by the Manufacturers."

Mr. Oswald F. Scott, the new President, Belleville

P. B. Yates, St. Catharines, Vice-president Niagara District

S. R. A. Clement, Toronto, re-elected Secretary

The Advisability of Electric Companies Handling Appliances and Supplies and Maintaining Standard Prices as Established by the Manufacturers

By W. J. Johnson*

"The Public be Damned" policy assumed by so many of our public utilities a few years ago has now been changed to a "The Public be Pleased" policy and it is well that they saw the wisdom of this change for there are very few companies that, had they still continued with their old methods would be operating to-day.

Until about fourteen or fifteen years ago, electric companies had been content to take such business as came into their office but made no systematic nor special effort to secure any additional business. It was also considered, at that time, that when you had once established your service to the premises, that there was nothing further to be done but render the monthly bills and to see that same was paid. It was also considered undignified for an electric company to send out representatives to secure additional business and to endeavor to increase the consumption of a consumer by showing him where and how he would benefit by using more of our service.

Since the universal adoption of the present high efficiency lamps, how many plants are there that would be earning their bond interest to-day if the standard of illumination had not been more than trebled and the use of current consuming devices so universally approved by the public.

Up to the time that electric companies started to handle appliances there were very few on the market and also very few manufacturers. There is no question but that the appliance business would never have amounted to very much if the central stations had not taken hold and pushed the sales.

At first most companies used to sell irons, which was the principal appliance sold, at the actual cost of the iron, without allowing anything for overhead or selling expenses and generally the cost of selling the iron would amount to as much as, or more than was received for it.

Some companies used to buy irons by the thousands which they would give to their customers absolutely free of cost, provided they were used on the company's service.

These methods of getting appliances in use on their lines, were no doubt effective at that time, but there have been great changes since then. At that time they used to figure that an iron meant a revenue of \$1.00 per month, and I guess you will all agree that if under our present rates, we could secure such a revenue from each iron, that we would gladly see that each of our customers had one, and that same was kept in good repair. At our present rates we are very thankful to obtain a revenue of 50c. per month from each iron sold.

It is pretty hard to state what the actual revenue from different appliances amounts to, as conditions vary so greatly, and while it is not very much from anyone, still it amounts to a fair sum for the total number in use.

Appliance Revenue is Net Profit.

With most companies the revenue for current used by small electric appliances is practically **net profit** for your service is established, and your investment is not increased.

You will also very often find that the desire for some appliance is responsible for the installation of wiring and fixtures for lighting.

I have never yet heard of a central station selling appliances just for the profit in the sale—but rather for the revenue to be derived from the use of that appliance. If this be so, then, it is up to use to get all the appliances in use

that we possibly can, providing the cost is in proportion to benefits to be derived.

How many of you managers and engineers can say that you have in your own home all the different current consuming appliances that can be profitably used? If you who know all about these appliances have not been convinced of their desirability, then think how much more difficult it will be to convince a person who does not know anything about them.

How can you expect an electrical contractor, hardware merchant, or departmental store to take the time or to spend the money to educate the public to the use of appliances as long as they are only interested in the profit from the first sale?

How many manufacturers are there to-day that depend upon some other organization or person for the sale of their goods unless they have some guarantee as to sales? You often hear of manufacturers who have previously sold their output through special selling agents and who have given up that method and are looking after the sales with their own employees—whether through jobbers or retailers.

As soon as business conditions become normal, you will find that a number of manufacturers of other lines will open retail branches in the larger cities, not with the idea of taking the sales away from the present merchants, but with the idea of increasing their sales in that locality.

I firmly believe that should electric companies discontinue the development and sales of appliances, that not only would the sales of such appliances greatly decrease, but that gradually the use of such appliances as are now in general use, would be discontinued.

I do not mean this as any reflection on the selling ability of electrical contractors or other merchants, but is due to the fact that they would not have the interest in the sales that a central station does.

If you will investigate you will find there are a very much greater number of appliances in use in the cities in which the electric companies promote and push the sale of appliances than where the sale is left entirely to dealers.

Public Has Confidence in Central Station.

The public expects the electric company to not only handle all the latest appliances, but to handle the best and at a fair price. Should they discontinue the sale of appliances, the market would be flooded by the unreliable "fly by night" merchants with cheap worthless and very unsatisfactory goods. This you know would hurt our business, the selling of electric current, more than one would think and would also kill the sales of reliable dealers.

Does the sale of appliances by central stations affect the sales of reliable dealers? Absolutely not, provided they both maintain standard resale prices which without a doubt all should do.

Where central stations push the sale of appliances it means increased sales of all dealers. Every appliance sold, provided it gives satisfactory service, helps sell other appliances.

The question of central stations maintaining standard resale prices on appliances has been discussed for many years until to-day you will find very few who will advocate any other policy. We must bear in mind that the price, as long as it is reasonable, does not sell nor hinder the sale of appliances.

The contractor-dealer cannot continue in business very

* Manager, New Business Department, Montreal Light, Heat and Power Consolidation.

long unless he can make a profit on the goods he sells, so that if you cut prices, you are forcing him to the wall or to get out of that part of his business.

Now place yourself in his position and how would you feel toward central stations? You certainly would not feel like getting out and boosting for them.

The merchant who makes a fair profit on appliances sold is going to boost and recommend them to all his customers, and if he succeeds in closing the sale will make a little profit, whereas you will make a profit every month that it is in use on your lines.

You operators of municipal plants as well as we, need all the friends and boosters that we can get, and such friends can do more harm or good than one would suppose.

If we cut prices it means that the other merchants must discontinue selling appliances and that we would, therefore, sell more, but that does not mean that we would have any more in service on our lines.

By maintaining prices we have that many more salesmen working for the company without being on our payrolls.

At the present rates for electricity what company can afford to sell goods at less than cost, for if your rates are so high that you can, then you are not playing fair with the public, and are charging some of your customers more than you rightfully should.

The question arises as to what is a fair resale price—for I must admit I do not consider some of the prices established by the manufacturer as being fair to the smaller retailer. I believe that resale prices should be based on the average costs of contractor-dealers, plus a fair margin of profit which would no doubt be higher than if based on the costs of a public utility.

Every cent of net profits derived from the sales of appliances, together with such additional amount as your directors will permit, should be spent in educational, sales, and good-will advertising.

There are cities to-day that sell two or three times the amount of appliances per person than other cities do, but the time is coming when the sales in even these cities will amount to treble what they are to-day. That day will be when the public is fully informed and convinced of the advantages of electrical appliances.

The manufacturers are doing a great deal to spread this information, and it is up to us to look at the matter squarely, and consider whether we are doing our fair share. We must bear in mind that the manufacturer makes only the profit from the sale, whereas we make the profit from the sale and also obtain revenue for current used by that appliance as long as it is on our lines. You benefit both directly and indirectly by every piece of advertising that you put out and every contractor-dealer and appliance manufacturer also profits by it.

Should Adopt the Goodwin Plan.

I do not believe there is any question but that it will be greatly to the benefit of central stations when the plan or platform drawn up by Mr. W. L. Goodwin, is adopted by all the electrical interests.

Far more can be done towards educating the public by all the electrical interests working together than by working singly.

The selling of appliances is a merchandising proposition, and the sooner we adopt the methods of some of our best and greatest merchants the better it will be for us.

Hardware dealers and druggists have lately started to handle appliances and the only reason they have made the success they have, is due to the fact that they understand merchandising. Central stations should make a serious study of this subject and we in turn should give the contractor-dealer the benefit of our knowledge.

They, as a rule, are not very good merchandisers, but I am glad to say that there are some who have seen wherein they would profit by same and are now leading the central stations.

Trade papers have taken up this subject lately, and should be commended for the very good work they are doing. We should not only read and study these papers, but should see that our employees are given the opportunity.

I am sorry that I cannot give you any interesting figures as to appliance sales for the reason that we are a combination company.

I will state, however, that we have four branch sales-rooms or offices which are absolutely self-sustaining, that is, the profits from the sales of appliances (gas and electric) more than pays all the expenses of the branches. We obtain no credit for current consumed by appliances sold.

We believe in having as nice branches as the locality will permit, but things can be overdone, and a place fitted up so grand that it will not do you the good that a less pretentious one would.

There is no question but that a neat, well arranged office will help your sales a great deal, provided same is properly managed.

The question of central stations handling neutral or allied lines has been discussed for the past year or so, and I believe, that it would be well for all to look into the matter. Personally, I am a firm believer in same, but it might not be advisable to adopt it in some cities.

With central stations it should not be a question of handling appliances and at resale prices, but rather the best merchandising methods to pursue.

Discussion on Mr. Johnson's Paper

Following the reading of Mr. Johnson's paper, the chairman pointed out that they were fortunate in having Mr. W. L. Goodwin present and called on him to lead the discussion.

Mr. Goodwin said that, in general, he thoroughly agreed with the points brought out in the paper, taking it for granted that the author believed in sound merchandising methods. There was no question but that all central stations ought to enter into this field, because it was unlimited. The main consideration was whether they go into it for profit or merely to put somebody else out of it by price-cutting methods. Under present conditions it was impossible for jobbers and dealers to make much profit because manufacturers did not leave a sufficient margin. It seemed to him that the utility company—whether publicly or privately owned—might pay for advertising of electrical appliances which would benefit dealers in general, since the utility derived revenue from the current consumed.

As illustrating the possibilities of development in the field of electrical merchandising, he pointed out that though the electrical dealers in the United States had been on the job fifteen years, they had only reached 5 per cent. of the population. There was \$100,000,000 worth of electrical goods sold annually, while it has been estimated that there is a possible trade of \$500,000,000 to \$800,000,000 per annum. It was therefore not a question of whether or not central stations should sell electrical merchandise, but **how** they should sell them. The central stations were in the business primarily to furnish energy, but he would like to see them open up stores that would be attractive and run on lines that would benefit the whole business.

In regard to the writer's statement that he had never heard of any central station entering into the business merely for the purpose of making profit, Mr. Goodwin said that he knew of several in the United States that had gone into it strictly as a business proposition and a separate enterprise.

He also disagreed with Mr. Johnson's statement that

manufacturers should open up retail stores in various centres. Mr. Goodwin pointed out that production and retailing are entirely different undertakings, requiring entirely different organizations and that the small local man in a community is invariably in a better strategic position than is the manufacturer operating over a wide area. They had been struggling with this problem in the States, and the manufacturers had decided against invading the field of retailing.

The real point at issue, he considered, was whether central stations would go into the business on the same basis as the dealers. Personally, he would rather see them keep out of the field altogether than to go into it with the idea of monopolizing it by price cutting methods, but he would like to see them conduct retail stores along proper lines that would benefit the whole industry.

Mr. Perry, of Windsor, pointed out that the primary object of any central station was to sell current, and appliances were placed on the market partly for the purpose of increasing the sale of current. He then cited the experience of the local Hydro department at Windsor, in the retail section of their business. In 1915 the merchandise sales had been \$11,050; in 1916, \$24,931; in 1917, \$44,793; in 1918, \$66,243. The number of the various appliances sold was as follows:

	1916	1917	1918
Lamps	27,833	34,268	29,111
Irons	989	908	1,491
Toasters	164	234	301
Grills	64	109	104
Percolators	21	40	36
Warming pads	14	8	13
Vacuum cleaners	67	78	79
Washers	16	44	43
Ranges	68	87	95
Fans	132	204	152
Heaters	51	261	253
Hotplates	16	56	66
Motors, single phase	12	11	10
Motors, three phase	9	16	26

In spite of this increasing business on the part of the Hydro store, Mr. Perry said the local dealers were doing a bigger business than ever before, and their mutual relations were very friendly. He was therefore strongly of the opinion that the central stations should get in on the game.

Mr. Madden, Ontario Hydro Commission, thought the paper very timely. He had just recently read that 64 per cent. of the appliance sales in the United States were made by the central station, and it seemed that the advisability of their going into the retail business was pretty clearly established by the action of the principal public utility companies. Most of the towns which had tried it were making a success of the undertaking. Once the construction stage is over, the question of building up a load comes up, and if the central station did not go into the business there would frequently be a long time to wait for results. In the case of ranges, for instance, the central stations had pushed this line in a way not possible to the small dealers. He thought they were coming to the point where central stations in general would go into the retailing business. Advertising, too, he considered was vital, and it was for the local Hydro departments to take the lead in seeing that proper advertising was done.

Mr. Sifton, of Hamilton, suggested that a resolution in favor of retailing by the central stations should be passed by the meeting and sent to the various local Hydro commissions along with a copy of Mr. Johnson's paper. There were frequently prejudices on the part of some of the commissioners, and if a resolution was passed by the municipal electrical engineers as a body it should carry some weight.

Mr. Sifton disagreed with the statement that the investment was not increased by the sale of appliances. In Hamilton they had made a canvass of the larger electrical stores, covering about 14, and had found that from December 1, 1917, to December 1, 1918, at least 3,200 appliances had been sold using over 500 watts. That meant something on the curtailed load, and necessitated increased investment. They had made more transformer changes this year than in any year previously because of certain districts getting in new appliances, while there had been no additional charge for such services. The speaker also mentioned the question of old houses in which electric wiring had not been installed. There were a number of such houses in Hamilton and the wiring would be quite expensive since no provision had been made for such improvement. Most of them were rented, and neither the landlord nor the tenant would make the expenditure. He wondered if something could not be done to remedy this condition and if an arrangement could not be made to wire these houses at reasonable cost. Mr. Sifton's motion regarding the sending of copies of resolution in favor of central station retailing and Mr. Johnson's paper to the local Hydro com-

Mr. H. H. Couzens, Chairman Papers
Committee

Mr. E. J. Stapleton, Collingwood,
Vice-president Georgian Bay District

missions was seconded by Mr. Myers, of Stratford, and carried.

Mr. Couzens, Toronto, pointed out that the difficulty seemed to be that in municipalities where they did not sell appliances it was thought that by doing so they would put the contractor-dealers out of business. He did not know of any case where a Hydro store run on proper lines had caused any disadvantage to the dealers, and in his opinion, an appliance department was highly desirable. In Toronto the power shortage had caused difficulty, and the sale of ranges had not been pushed in the local Hydro store, but the sale of other

Mr. R. C. McCollum, Toronto, Re-elected Treasurer

appliances had increased and the department was on a self-supporting basis.

Regarding the wiring of old houses, Mr. Couzens said that a number of schemes—free and assisted—had been tried in various cities and towns elsewhere, with little success. He thought, however, that in Canada, where everybody so fully realized the great advantage of electric service, the landlords would really be forced to make the installations. He also suggested that in certain districts it might be a good idea to supply landlords whose houses had electric service with a little illuminated sign, "This house electrically wired." Mr. Couzens drew attention to the fact that this paper had been written by Mr. Johnson, of the Montreal Light, Heat and Power Co., a private corporation, for presentation before the Municipal Engineers Association, which he considered pretty good testimony that their association was not a political one, and that the ideal of all electrical men getting together on a common ground was by no means an impossibility. One reason, he thought, why the contractor-dealers had been considered as antagonistic competitors was because they had not got together sufficiently. In Toronto they had done so with splendid results. If the contractor-dealer was willing to do business along proper lines, he should be encouraged and helped, but if he persisted in doing business upon a wrong basis, it was a matter of education and this was up to the central station.

At this point it was suggested that Mr. Sifton's resolution be amended to provide that a copy of the discussion be sent along with the copy of the resolution and Mr. Johnson's paper to the various Hydro commissions, and it was decided to do so.

Mr. K. A. McIntyre, president of the Ontario Association

of Electrical Contractor-Dealers, said that he thought what Mr. Couzens had said was exactly right. He was sure they could increase business by co-operation and no club was needed. The contractor-dealers had no club, but they were seeking a basis of co-operation, permitting of consultation and discussion, and the sooner this was brought about, the sooner would the electrical men in Ontario achieve their ambitions for the development of the industry.

Mr. Archibald, of Woodstock, said that in that city they had not sold appliances to any great extent, only irons and toasters. One reason for this was the location of their office, which was bad for retail business, and they had considered the city too small for the establishment of a Hydro shop. Also there had been considerable objection raised to such a step, by the local dealers.

Mr. Fisk, of Peterboro, said that he was not opposed to the handling of appliances, but their office was on a side street, and there were three live contractor-dealers who pushed the business.

Mr. White, of Dundas, made reference to the resale price of appliances. Often the manufacturer attached a resale price, while the Hydro Commission assumed the authority of fixing the prices of all appliances sold by the local utility. There were hardware stores selling appliances, whose proprietors thought they were ill-used on this account.

Mr. Madden suggested that Mr. Goodwin's paper to be presented at the morning session would cover the question raised by Mr. White. He was anxious to be informed, however, as to the size of a town which could support a Hydro shop.

Mr. Shearer, of Smith Falls, said that the local department in his town had dispensed nearly \$4,000 worth of appliances the previous year. The local dealers who handled electrical appliances were well satisfied, however, and the department was doing nearly all the advertising of electrical appli-

Mr. V. S. McIntyre, Kitchener, Chairman Conventions Committee

ances. At times they had mentioned the names of the dealers handling appliances.

Mr. Dusenberry, Hughes Electric Co., referring to the development of the electric range business, said that undoubtedly up to the present time the central station was the source of development in that line. The contractor-dealers, except in a very few cases, were unable to take it up on the same scale and push it. His firm did not make any distinction between the central station and the dealer.

Mr. McIntyre said that the reason the contractor-dealer did not push the sale of electric ranges was because the man-

ufacturers only allowed about a 15 per cent. margin, which was not sufficient to give him a fair profit.

Mr. Rutland, of the Moffat Stove Co., answering Mr. McIntyre's statements, declared that for two years he had tried to sell electric ranges to the dealers and had not been successful. His firm found the central station the logical medium for the distribution of their ranges. There were simple troubles which arose in connection with the ranges, which, he said, the contractor-dealer was frequently unable to make right, while the central station always had men who had the necessary knowledge.

Mr. McIntyre said he was not criticizing the central sta-

tions for taking up and pushing the range business, but he thought the previous speaker must have made a mistake in judgment in the contractor-dealers he dealt with. Every contractor-dealer, he declared, had contact with hundreds, or thousands, of homes. Why then was he not the logical man to develop the range business?

It was here suggested by Mr. Buchanan that copies of Mr. Johnson's paper and the discussion be sent also to the contractor-dealers, and this was decided upon.

A motion was also passed that the thanks of the convention be conveyed to Mr. Johnson for his paper and that he be sent a copy of the discussion.

Bare vs. Weatherproof Covered Wires for Potentials Above 750 Volts

By Mr. A. S. L. Barnes*

The object of this paper is to bring before you an oft-debated question of considerable importance to those interested in overhead distribution work.

Some time ago the Chief Engineer of the Hydro Electric Power Commission of Ontario appointed a Committee on Rules and Regulations for Outside Overhead work, consisting of members of the engineering staff, and this subject was discussed on a number of occasions by that Committee, but without any final decision being reached, as there were warm advocates of each side of the question.

The Chief Engineer of the Commission was desirous that this matter should be brought before this Association and your Committee considered it well worthy of serious attention.

In the preparation of this paper, the object kept in mind has been to invite discussion of the subject of it rather than the paper itself and it has therefore been my endeavor to marshal a few facts, together with the statements of various authorities regarding this question, in such a manner as to fix in your minds some concrete ideas out of which useful discussion may arise; if this results, the paper will have fulfilled its purpose and the intentional omission of many personal expressions of opinion will have been justified.

The N. E. L. A. Handbook on Overhead Line Construction, dated 1914, contains the following under the heading of "Weatherproof Insulation":

"A trade name for a character of insulation consisting of one or more layers of braided material, soaked in an insulating compound."

In another part of the book we find this:

"In the manufacture of triple braided weatherproof wire, the wires are covered by three closely and evenly woven braids of a strong fibrous material after which they are placed in a hot bath of weatherproof insulating compound."

The Standard Handbook for Electrical Engineers, 1915 Edition, says:

"The so-called weatherproof insulation becomes a reasonably good conductor when moist. Triple braid weatherproof conductors have three braids saturated with a so-called weatherproof compound, served around them. . . . Triple braid weatherproof conductors are approved by the National Electrical Code for outside construction, but double braid conductors are not approved at all."

The National Electrical Code, 1918 Edition, states:

"This wire is for use outdoors, where moisture is certain and where fireproof qualities are not necessary. The insulating covering shall consist of at least three braids, all of which

must be thoroughly saturated with a dense moisture-proof compound."

One thing which has struck me rather forcibly about these extracts, is the use of the expression, "weather proof insulation," which is very commonly employed.

No one pretends for a moment that weather-proof covering is insulation, at least not for voltages from 2,200 upwards, so why call it by such a name?

The word "insulation" in connection with weather-proofing is a mis-nomer and I would suggest that "weather-proof covering" be used instead. The public, and particularly the legal profession, are seriously misled by the use of an expression for which no justification is to be found.

I observe also that while the National Electrical Code specifies the use of triple braid, it is common practice apparently, in Canada, to use only double braid, indicating a difference of opinion as to the degree of "insulation" for which it is worth while to pay. The balance between safety and its cost is evidently not thoroughly established.

There are many conflicting ideas on the question as to whether the use of weather-proof covering should be continued or abandoned, for potentials above 750 volts, and it is believed that the following views expressed by various authorities will prove interesting here.

In the N. E. L. A. Bulletin for September, 1916, Mr. G. S. Humphrey, speaking of primary conductors, says:

"As to whether wires shall be bare or insulated, we have been specifying that insulated wires shall be used only in Salt Lake, Ogden, Provo and Logan; bare wires being used in all other places unless insulated wire is prescribed by some local ordinance. We don't believe there is any real protection afforded by the standard weather-proof insulation, at least, if there is, it is only for a comparatively short time while a false sense of security because of the insulation may cause injury to someone. An insulated wire is more apt to be broken by the wind or sleet than the same size bare wire, and it cannot be held in place so well. The bare wire is, of course, much cheaper than the insulated, both because of the saving of the cost of insulation and also because of the saving in cost of poles and fittings, since longer spans may be used with the bare wire. The advantages of the insulated wires are that interruptions due to crossed wires may be slightly reduced."

In the N. E. L. A. Bulletin for November, 1916, in an article by Mr. A. S. Hall, occurs the following, which has reference particularly to rural lines:

"The insulated copper which has in the past been regarded as proper for city uses is entirely out of place in rural construction. It shortens the span, thereby increasing support

* Assistant Engineer, Hydro-Electric Power Commission of Ontario.

cost and the insulation does not add any great factor of safety in the rural districts."

A Plea for Better Insulation.

Below is an extract from the Electrical World of January 31st, 1914, taken from a report of a paper read before the Western Association of Electrical Inspectors on "Whether 2,300 Volt Primaries should be run without insulation on the conductor itself":

"Mr. McGann has conducted at the electrical laboratories of the city of Chicago a number of tests on various samples of weather-proof wire to determine the effectiveness of the insulation as a dielectric after different periods of use. These tests were made on dry and immersed samples, new and in service for three, five and ten years. While new wire with moisture repellant still in place withstood four times the normal voltage of the lines, wet samples barely withstood the line voltage to ground, but showed a good factor of safety for line crosses where the insulation of two wires is interposed. Samples taken out of lines which had been in service several years, had lost very considerably in dielectric strength dry, but even more wet, and none but the new wire gave an insulation test indicating reliable protection for line men on poles. The tests show that in general even wet insulation may, for 2,300 volts, be depended on for ten years, if the insulation remains intact, to prevent break-down when wires of opposite polarity swing together. Mr. McGann drew the conclusions that present standards of weather-proof insulation give a distinct advantage over uninsulated wires by protecting against primary contacts to secondary, promoting continuity of service and protecting linemen in dry weather or with new insulation. Mr. McGann concluded with an earnest plea for a better insulation for overhead wires, asserting that dearer line construction would be repaid by greater safety to life and apparatus and by continuity of service, and suggested that the overhead wiring committee bring in at its next meeting specifications for such an insulation.

"While not intended as at all exhaustive, this series of tests marks a real advance in the present knowledge of the value of weather-proof insulation for 2,300-volt construction. The question of 6,600-volt construction was not touched on, and at least for present insulation Mr. McGann recommended the use of insulating gloves by linemen working on live 2,300-volt lines."

In 1917 some tests were made by the Hydro Electric Power Commission on double braid weather-proof covering, the results of which are given below:

Comparative Tests on No. 6 B. & S., D. B. Weatherproof M. H. D. Copper Wire

Weight, lbs. per 1,000 feet		Tensile Strength Wire (lbs.)	Lbs. per Sq. in.	Insulation Resce. Megohms per mile		Breakdown Voltages		
Bare	Covered			Dry	15 hrs. Immersion	New	After Baking	After Boiling
A. 77.06	100.7	740	37,000	23.6	3.85	3,600	2,000	800
B. 78.64	101.8	713	35,500	12.5	2.74	3,000	1,200	800
C. 80.77	103.5	736	36,800	17.75	2.94	1,200	2,600	800
D. 79.25	102.1	722	36,000	*35.5	*3.42	1,200	2,600	800

*Comparative figures only. Not sufficient length of wire used.

These tests were not at all exhaustive, but the records of break-down voltages, it will be seen, are too low for safety and are also erratic, showing that no reliance can be placed on such covering—this, of course, is a well-known fact, but the figures corroborate it.

The following is taken from Bulletin No. 75, Circular of the U. S. Bureau of Standards,—"Safety for the Household."

"In this connection it should be understood by all members of the household that the insulating covering on high voltage wires cannot be depended upon for safety of persons touching them. It is not feasible to maintain reliable insulating covering in swaying overhead wires, such insulating cov-

erings as they do have, serving principally to minimise the probability of short circuits between wires and their consequent breakage when crossed by fallen twigs or by other wires."

Later on, this sentence occurs:

"Insulated overhead wires should be treated the same as bare wires since the insulation quickly becomes defective in outdoor use."

I would like to say here that the use of the word "insulated" in the last quoted sentence appears to be particularly unfortunate as it decidedly gives the impression that the covering when new is a fairly good insulation.

Omission is Often a Safeguard.

Mr. S. B. Hood, whose name is probably well-known to all of you, was reported in the Electrical News some time ago as saying:

"Insulation which is not a protection is a death trap and its omission is both a safeguard and an economy."

Below are quoted successively, letters from various authorities in the United States to whom enquiries have been addressed regarding the subject of this paper:

Letter dated September 19th, 1918.

"Dear Sir:—Referring to your letter of August 21st, addressed to the National Electric Light Association, inquiring as to the views of the Commissioner on the subject of Bare versus Weatherproof Wires for Potentials above 750 Volts, I will endeavor to give you what I believe to be the consensus of opinion of those who are operating distributing systems throughout the States.

"In the Eastern part of the States, it is very general practice to use weather-proof insulation on all wires erected in the built-up portions of cities. This is done quite generally on voltages up to 13,000 and in some cases on higher voltages. The use of weather-proof insulation on circuits above 7,500 is chiefly a matter of complying with municipal ordinances which are designed primarily to cover the ordinary distributing circuits operating at voltages below 7,500. These ordinances in most cases do not discriminate between distributing and transmission voltages, and weather-proof wire must therefore be used within city limits in order to comply with the law.

"In smaller towns and in the far west, it is not unusual to see bare wire used on distributing circuits up to 7,500 volts.

"In large systems where there is more than one arm on a pole and where it is customary for men to work on the lines alive, the use of bare wire is not considered safe for linemen.

"Weather-proof insulation is not considered as a complete protection to linemen against ordinary distributing voltages under 7,500 volts, but taken in conjunction with the wooden poles is a very material aid in avoiding accidents. Companies operating the larger systems usually have rigid rules requiring joints to be well taped, and permitting no bare connections of any sort on poles where men are required to work. It is customary, however, to use rubber blankets or other protection, as the condition of insulation of various ages is uncertain and cannot be wholly depended upon.

"The presence of weather-proof insulation is of considerable assistance in minimizing damage to communication sys-

tems which may become crossed with lines operating at voltages below 7,500 volts, and there are numerous cases on record where crosses of this kind have occurred in which the insulation has protected the communication circuit from damage.

"At voltages above 7,500 the insulation ceases to be a material protection, either to linemen or to communication circuits, and the use of weatherproof insulation, therefore, involves an additional investment which does not appear to have compensating advantages.

"I am not sure whether this is the sort of data which you are seeking in the matter, but from a wide acquaintance with engineers who are operating such circuits and with committees who have assisted in making safety rules affected by this question, I believe that the above is a fair statement of the situation in the States.

Yours very truly,
(Signed) H. B. Gear, Chairman,
Committee on Overhead Lines and
Inductive Interference, N.E.L.A.

Letter dated October 9th, 1918.

"Gentlemen:—Replying to your inquiry of October 3rd, we are unable to advise you at the present time of any city which specifies the use of bare wires for overhead electric lines above 750 volts.

"It is generally conceded, however, that weatherproof covering on such wires deteriorates very rapidly and it is doubtful whether any useful purpose is achieved by requiring such a covering. It is sometimes claimed that hazard is increased where such a covering is used on account of the false sense of security suggested by the presence of insulation which may be inadequate and hence dangerous.

"Since the National Electrical (Fire) Code requires this insulation, it is used by many utilities who do not approve of it merely in order to conform to the rules. It would seem very desirable to obtain wider experience in the use of bare 2,200 volt lines in order to demonstrate the question of relative hazard.

(Signed) S. W. Stratton,
Director Bureau of Standards,
Washington, D. C.

Letter dated October 24th, 1918.

"Dear Sir:—In replying to your inquiry of the 19th, relative to the use of bare wires for overhead distribution circuits above 750 volts, we would offer the following as expressing our opinions covering the various points which you mention.

"Our practice is in favor of bare wire for primary distribution circuits. For voltages 6,600 v. and over, we invariably use bare wire unless local regulations require the wire to be insulated, in which case we endeavor to secure a modification of the regulation. For 4,000 v. and in general, for 2,300 v. we use bare wire where Governmental and local requirements do not conflict. The following opinions have been reached as a matter of judgment from our operating experience in various parts of the country, rather than from compilations or analyses of statistics.

"The slight temporary and generally undependable protection afforded by the covering is usually more than offset by the largely increased wind and ice loadings which the covering occasions. Bare wires are less likely to stretch or break, are steadier in the wind and impose less loads on fastenings and structures. We have heard the statement that sleet forms less readily on bare power wires, but we have no knowledge as to this point.

"On lines with suitably spaced and supported conductors, the tendency to interruption from swinging crosses is so frequent troubles such as broken conductors and crosses and

largely decreased as to be more than outweighed by the more stretched conductors, which result from the use of insulation; that is, there is a net gain against interruption by omitting insulation.

"While in a liberal percentage of cases of contact, insulation may afford protection against shock to linemen working on live wires, the presence of insulation creates a false sense of security on the part of the workmen, which tends to carelessness. The only safe rule for linemen is to treat all primary wires as if bare, and this rule will be more effectively observed if the wires actually are bare. When live primary wires are to be worked upon the use of protective devices, such as portable shields, are much more effective protection to linemen than insulation on conductors.

"The use of covered wire is more expensive, owing both to the greater initial cost and to the fact that the wire must be replaced when the covering begins to disintegrate.

"We trust that we have covered this matter in accordance with your desires.

Yours truly,
(Signed) P. J. McLelland,
Electric Bond & Share Co., New York.
Chief Engineer."

Conclusions.

So far as I have looked into the question, there seem to be four main points on which opinions differ, and if a suggestion as to procedure be not out of place, I would propose that discussion be centered around these points, preferably in the order given so far as it is possible to treat of them separately.

The four points are:

1. Safety.
2. Operation.
3. Cost.
4. Public opinion.

These main headings may also be sub-divided, in their relation to other factors, as follows:

1. Safety (in erection, operation and maintenance).

To: (a) Power linemen.

(b) Telephone and telegraph linemen.

(c) The public.

2. Operation

Of: (a) Power lines.

(b) Power stations and sub-stations.

(c) Telephone and telegraph systems.

3. Cost

Of: (a) Wire,

(b) Labor,

(c) Operation,

(d) Maintenance.

4. Public opinion.

(a) General Public Opinion.

(b) Opinion in the Law Courts.

At this stage I will leave matters in your hands in the hope that the subject has been so presented that profitable discussion, leading to definite conclusions upon which decisions as to future action can be based, may result.

Discussion on Mr. Barnes' Paper

Following the reading of his paper, Mr. Barnes referred to a table on the blackboard showing relative costs of bare and covered wire. The table is printed below:

	Relative Costs			
	War Prices		Pre-War Prices	
	No. 6	No. 0	No. 6	No. 0
Bare	100	100	100	100
D.B.W.P.	130	128	135	135
T.B.W.P.	145	136	150	148

It was suggested by Mr. Lang, Ontario Hydro, that the

matter in a nutshell, as regards the use of bare vs. weather-proof covered wires, appears to be this: The weatherproof covering forms quite a large percentage of cost of the wire—between 25 and 50 per cent., and the question was whether the covering was of sufficient value to justify this extra expense. In one small system recently constructed, the saving by the use of bare wires was about 3 per cent. If this could be saved on the wires, they could put the money into other methods of protection—such as the wider spacing of the wires on the pole arms. Even among linemen there is a difference of opinion. Some said it was of real value and others that it was practically useless.

Mr. Wills Maclachlan, Toronto, thought that the weather-proof covering was of no value at all. It was a case of placing an insecure protection around a grave danger, and the peril to the public was greatly increased, because they were under the impression that the covering constituted a real safeguard. If there was no covering on at all, they would keep clear of exposed wires. Mr. Maclachlan also thought that the linemen were just as safe working with bare wires. They should, of course, be provided with well-tested gloves and mats. There was a great danger in their trusting the weatherproof covering for protection.

Mr. Latimer, Ontario Hydro, was of the opinion that insecure insulation, which is not a protection, was a death-trap. With regard to the letter from R. J. McLelland, quoted by Mr. Barnes, in which it was stated that for voltages of 6,600 and over, the practice was to use bare wires, the speaker said he would favor including 2,300-volt lines under this regulation. The difficulty of swinging wires could be eliminated by greater pin spacing.

Mr. Cook, New Toronto, mentioned an instance of where two horses were killed when a bare wire blew down. After that there was an insulated wire put up, and there had been no further accidents.

Mr. Bell, of Mimico, also believed that the insulation was of benefit, and cited a case in which it had been the means of saving a man from death or very severe injury. He was working with this man on 4,000-volt lines, phasing them out, and had seen his companion come in contact with a line, and only for the weatherproof covering he would undoubtedly have been killed. As it was, he was little the worse.

Mr. Ireland, Ontario Hydro, said that life hazard was the essential point to be considered. If the covering contributed to safety, the cost should not be considered, but if it did not give protection it should be discarded. Personally he did not know of any cases in which men's lives had been saved by the weatherproof covering, and he would not put any dependence on this covering on lines carrying over 600 volts. It was of use, however, in 110 and 220-volt secondaries, which had often to be strung around where clearances were small, and there would be many cases of short-circuits if the wires were bare. On primary and series services, however, he thought the covering should not be used.

Mr. Heeg, Guelph, also thought that primaries would be better without insulation. In the old days when the voltage was 1,100 or 1,240 and the insulation seemed to be better, it might have been of real value. He had recently taken down some wire which had been up for seventeen years and some of it was better than what had just recently been installed. He was in favor of using bare wire for 2,200 volt lines.

Mr. Fisk, Peterboro, considered that the weatherproof covering indicated the fact that the wires were dangerous.

Mr. Coleman, Port Hope, said he did not agree with the many opinions expressed in favor of discarding weatherproof covering. He knew of three instances in which he believed the covering had been the means of saving men's lives, while he also knew of one where a man had been killed through contact with a covered wire. He mentioned a case of a man

sitting on 2,200-volt wires when he discovered they were live, but escaped without injury, and another of a man picking up a covered wire from the street without fatal results. He therefore thought that the wire, while not an insulation was some protection.

Mr. James, Ontario Hydro, was of the opinion that the question of covering the wires was more or less sentimental. He did not think there was an engineer in Canada or the United States that would assert it was a protection, but the step was a drastic one and for that reason they hesitated to make the change. He believed it was a false safeguard and that if the wires were bare, workmen would be alive to the danger and would not touch them.

Mr. Sifton, Hamilton, thought no drastic step should be taken, and that it was a question of education. He suggested that in rural districts, bare wires might perhaps be used for 2,200 volts, but where the public and the linemen were accustomed to look for covered wires, it should still be used. He had taken the question up with the linemen and they said they would rather work with the covered wires.

Mr. E. M. Ashworth, Toronto, thought the general public would not stand for the absence of insulation. In his opinion, they required safety and it would be well for the committee to take up the question of obtaining a wire covering that would be safe. The proper course was to try to procure adequate insulation.

Mr. Latimer said that at various inquests he had had to attend, it had been brought home to him that insulation could not be depended upon. Gloves, shields and mats, or grounded surfaces around the poles, he believed was the only method of dealing with the problem.

Mr. Ostrom, Northern Electric Co., declared he was quite willing to admit that the so-called weatherproof insulation might not at all times serve as a protection.

Mr. Wright, Eugene F. Phillips Co., years ago had strongly advocated bare wires, but now he believed that for voltages up to 2,200 volts it was a safeguard. Protection to the public was also a consideration, particularly in the case of damage suits, and legally, he understood, it was required that the lines be insulated. Mr. Wright believed that for every accident reported where weatherproof covering was used, there were several averted.

Mr. Martindale, Sudbury, did not think that drastic action should be taken, and cited instances where accidents had been prevented by the use of the covering.

Mr. Alford, London, said that after 19 years experience, he believed that it was more satisfactory to use the covering, both from the standpoint of cost and public opinion. In the first place, in construction work, covered wires could be strung among other wires without danger. Also, there was not the same danger of wires grounding. And, in the second place, while the covered wire cost more, he believed the difference was more than made up by the fact that linemen could work faster and with a greater degree of safety. Finally, public opinion would be against anything that would appear to be dangerous. He had been working in London for the past twenty years and had yet to have a man go to hospital through coming in contact with a covered wire. As to gloves, one could supply them to linemen, but as soon as his back was turned, they put them in their pockets.

In regard to stringing wires across another company's lines, Mr. Lawlor, Ontario Hydro, pointed out that, if insulation were not used, the poles would, of course, be made high enough to give a safe clearance over the other lines. In London, he said they used ground insulation on everything over 5,000 volts.

Mr. Maclachlan emphasized the necessity of testing rub-

ber gloves and shields. These should be tested monthly to be of any value.

It was then suggested that a committee be appointed, consisting of outside superintendents and managers, particularly men who had a good deal of experience on construction of line work and that they report at the next meeting. This was decided on, the selection of the committee being left to the chairman. This committee was later announced as follows:

R. H. Martindale, chairman; Messrs. Bell, Mimico; Cook, Niagara Falls; Heeg, Guelph; and Alford, London.

At this point it was announced by Mr. Clement, the secretary that Mr. W. R. Clarke, of Beaverton, one of the members of the association, had passed away. The deceased had fully intended to be present at the convention, but had taken ill rather suddenly and had died on Saturday, January 25. The meeting unanimously resolved that an expression of sympathy be sent to Mrs. Clarke in her bereavement.

The Thursday Evening Dinner

On Thursday evening the delegates met at 6.30 dinner at the Carls-Rite Hotel, where songs, the renewal of old acquaintanceships and good fellowship held sway for an hour and a half. Brief addresses were given by Mr. Goodwin, Mr. Sifton and representatives of the various manufacturing and jobbing member companies. Mr. C. H. Hopper also spoke at some length on the kindly relationship existing between the travelling salesmen and the Hydro managers and engineers. Mr. Hopper said in part:

I am sure that you will be glad to know that I am a firm believer in the brief after dinner talk unless the speaker be one who has a subject of real import and is an authority on that subject, but I have accepted your president's very flattering invitation to talk to you this evening with the idea that just while you are smoking your cigars—and are thus probably lulled into a sense of comfortable tolerance—for I know these Front Street cigars—you would be willing to listen to a salesman who would have you know that the man who follows the Hydro-lines—who travels the Hydro trail—finds in life and in his relations with you something more than orders, something more than that which can be estimated only in dollars and cents. And I feel that the sentiments of my brothers of the trail are in hearty accord.

Hydro means much to the people of this province, it means much to the electrical profession, but to me, and my brothers, it means all that it is to them, with the pleasing addition that it has blazed a trail for us to follow; on which we find friendship as well as business, good fellowship as well as orders. For you seem to realize that we travellers belong to the same human family as yourselves. That the transient, who drops into your office between trains, throws his portfolio on top of his competitor's goods, jollies the stenographer and wants to know if the "big noise" is in, is a man capable of really fine feeling if you draw him out—and he is particularly susceptible to the drawing process, after business hours, of course. He has the same faults that you have, provided he can ascertain just what those faults are, only he has them a little more so. And when the lighting load comes on, he has the same yearnings for companionship, for home and family, only the pain is somewhat dulled by constant denial.

It is then that he thinks of all those little homely details peculiar to his own household. It is then, gentlemen, that the traveller finds life on the road drab and tasteless, especially tasteless, now. And right there is where the men one meets on the Hydro trail, seem different from those of any other trail I have travelled. Because each one of us has found

among the men he calls on some kindred spirits, some congenial souls, who strike a sympathetic chord and with whom he finds much in common, entirely aside and apart from the buy and sell world. You make us feel we are indeed all members of the great electrical scheme, that we are all moving the same direction, each having his particular part to perform for the good of the whole, none being, in the general sense, independent of the others' effort, each being a lever that moves the other, only sometimes, we have to pry mighty hard.

The traveller is a current flowing across the great electrical ocean. He mingles with the electrical waters from all points of the compass. He knows as probably no other member of the fraternity knows how immaterially few there are who are impelled in their activities by any other than a wholesome and genuine desire to conduct their part of the scheme, to play their part of the game, in a manner that squares with the common rules of good business fellowship.

And now that there are movements afoot with the objective of a complete organization of the electrical family, it seems to me that, right under the surface, there is now an organization—an organization without a practical code of rules as regard details, but based on those principles that find a home in the hearts of all decent fellows, and if, to that organization of proper spirit that now exists, there can be fitted the harness of practical association without disturbing the fine impulses of squareness that naturally flows through our electrical community, the advocates of this movement will find the work already complete in all but the placing of the keystone.

Square D Co. Open New York Office

The Square D Company, Detroit, manufacturers of Square D Switches, opened a new Metropolitan Office at 149 Broadway, on January 1st. J. A. Jaques, district sales manager, has been placed in charge of the office. Mr. Jaques was formerly connected with the Pittsburg office of the Square D Company. At one time he was a member of the sales organization of the Western Electric Company. Mr. Jaques will represent Square D interests throughout the Metropolitan district.

Increase in Southern Canada Power Receipts

For the three months ending December last the gross receipts of the Southern Canada Power Co. at \$144,648, showed an increase of \$32,053, and net at \$66,455, an increase of \$16,664. The water power development at Drummondville is progressing satisfactorily. The plant will have an ultimate capacity of 18,000 horse power, and it is expected that equipment for 7,000 horse power will be installed and in operation by May 1st next.

Daylight Saving and the Coal Supply

Canada adopted the daylight saving idea last year, as also did the United States, because of its successful operation in Great Britain, France, Italy, Germany, Austria, Holland, Denmark, Sweden, Norway, Portugal, Australia, and Iceland. The United States Fuel Administration has computed that 1,250,000 tons of coal were saved in the seven months during which the system was operative. This figure was based upon a large collection of data, and also upon definite records for one community of about 1,000,000 population.

Mr. Harry S. Anderson, treasurer of the Masco Company, Limited, Toronto, jobbers of electrical supplies, died recently.

The Goodwin Plan Meets the Approval of the Ontario Municipal Engineers

Mr. W. L. Goodwin, whose famous plan is now known more or less to every electrical man on both sides of the line, was called upon on Friday morning by the chairman to explain his scheme to the municipal electrical engineers of Ontario.

Mr. Goodwin, in opening, pointed out that there were two distinct problems in the electrical industry—one relating to the creation of energy producing stations and the production, distribution and sale of the energy. That problem involved primarily financial and engineering questions. The other was the production of articles for the distribution and consumption of the industry's principal product, energy. In the first case, dealing with a commodity which is known, there would develop a natural monopoly which could best be handled by a single interest. Eventually, being an article of general public use, it would resolve itself into one of public ownership. Perhaps the Province of Ontario was just a little in advance of the rest of the world, but sooner or later the public ownership of all electric light companies is bound to come.

For the present, however, Mr. Goodwin said he was not concerned as to whether the utility company was publicly or privately owned. His problem had to do solely with what he called the manufacturing or merchandizing part of the business and that part of the business cannot become a monopoly and can never be publicly owned. It consisted, to a large extent in dealing in "style and habit" goods and depended for development on the whims of the general public, whose ideas vary widely, so they would always be selling articles in competition with each other to meet the varying ideas of the larger mass of the people. In the broad sense the consumers would not be satisfied with the same article, the incandescent lamp being an exception, since it had become a necessity and they were not concerned in its manufacture or style, providing it gave proper light. But in all other products of the industry, such as irons, toasters, fans, grills, etc., there was the scope for individual taste, and each purchaser preferred to make his own selection.

A proper merchandizing policy and good salesmanship were necessary to develop the second part of the industry. Electrical men had experimented with every conceivable policy to get their goods before the public. He had fussed with this problem for twenty-eight years and tried out every policy ever suggested. It should have been plain that many of the plans experimented with were impracticable. They had got to follow the precedent of about 500 years and there was nothing new to be developed. All one had to do to discover the best merchandising methods was to walk down the city streets and see what merchants were doing. In the States, the idea of the early pioneers was selling at cost and bargain sales and these were tried for about ten years. Notwithstanding that some of the utility companies sold at cost and sometimes less, they had never been able to sell in any great volume—first, because the public preferred to make a selection, and, secondly, because no man with one line of goods could hope to please the public. Selling energy is one thing and selling goods another; no central station could possibly reach all of the people.

Monopoly Hampers Trade

There were hundreds and hundreds of houses not wired for electric service but no central station, no matter how ag-

gressive, could ever accomplish very much in the wiring of old houses by cost price and bargain sale methods, for people have different ideas about what they want. In this way anything tending towards a monopoly hampered the trade, whereas if all the factors were developed, manufacturers, jobbers and retailers, different ideas were brought out which appealed to different people.

The greatest results, Mr. Goodwin said, were produced by increasing the number of retail stores and the number of manufacturers producing articles with different selling points. At the Pacific Coast, where he had been in business, they had tried all the different plans in different communities. First they had tried selling the product through the central station as a single unit, the station undertaking to do the wiring. In another community they tried the plan of selling the product and the wiring at less than cost and adding the difference to the cost of the current. Finally they had determined the cost of the energy as one thing and the cost of the goods as another and then created manufacturers, jobbers and retailers to bring the goods to the public, and for ten years they had proved this plan to be the most satisfactory. In other words, this went to prove that the greater the

Mr. W. L. Goodwin

number of points of contact with the public, the greater will be the sale of energy and appliances—bearing in mind all the time that there are two different problems, merchandize and energy.

In regard to the sale and distribution of energy, there were wide differences of opinion, and they would probably have to go on experimenting, but in the other problem, merchandizing, they had learned a lesson and reached a standard, and after 500 years experience the path ought to be pretty clearly set, so that there should be no difference of opinion as to the best methods to apply.

Mr. Goodwin pointed out the result of the proper application of these methods on the Pacific Coast, as compared with the chaotic condition of the industry in other parts of the country. East of the Rockies, including the thickly

populated districts where climatic and other conditions favored the use of electrical appliances, the per capita sales per annum only amounted to \$2.50, as against \$30 per capita on the Pacific Coast, where the climatic and living conditions, generally, do not make electrical appliances as necessary to the comfort of the population.

More Electrical Stores of the Better Sort

Mr. Goodwin said he had come to tell them the results of the experiments in the United States. In Canada there was an opportunity for the development of the industry at a far greater rate than the central station could ever take care of. It was not a question of building central stations for the purpose of forcing the public to buy current, but, with proper organization, it would be a question of finding the money to build the necessary central stations. To accomplish the best results, we must provide innumerable means of contact with the public and that means of contact must be high class retail stores operated all over the Dominion. The greater the number and the better the character, the more rapid the development. We must not let unkempt, poorly-managed, electrical shops stand in the way of progress. If one considered conditions in the United States, it was found that 40 different merchandising policies of manufacturers and jobbers had prevented proper retail distribution. Men engage in the retail business for profit, and you can't expect them to take it up unless they have some reasonable assurance of success. With proper retail distribution, innumerable manufacturing concerns would spring up. In the States there were more than 1,900 manufacturers, 300 jobbing concerns, 25,000 specializing in electrical contracting, 75,000 other concerns selling devices and appliances of one kind and other. While they had had a certain amount of direction on the commercial side of the business they had built up powerful organizations representing the four great groups, and these groups had grown without direction, their purpose being to develop their own branch of the industry without regard to the others. The central stations formed their organization primarily for the purpose of strengthening themselves; the manufacturers formed their organization without regard to the problem of retail distribution; the jobbers concerned themselves with wholesaling only; and the contractors, with installation. In twenty-five years these four great organizations had never met together for the purpose of discussing questions of common interest. When they had such a great industry, was it not a mistake to permit it to go ahead without some direction? These four great organizations are formed and then they start to tear themselves to pieces at the expense of the buying public.

The suggestion of getting together for the development of the industry was generally misunderstood by the various groups and by the public alike—first, because the collective bargaining had been carried on behind closed doors. When this policy was followed, it was bound to result in a discussion along selfish and narrow lines. All meetings should be held with open doors and the public taken into confidence, for we could never develop an industry that would stand unless our intentions and motives were beyond suspicion. To bring these groups together for a common purpose, it must first be recognized that in each there are specialized problems. A man selling merchandise is not at all interested in a discussion as to the proper frequency one might use in the development of a new machine. Neither would an engineering association be very much concerned whether the length of an appliance cord was six, eight or ten feet. Therefore a lot of time and money and energy would be wasted if the groups were brought together on all the problems of the industry. A single organization should be built up for the discussion of questions of common interest,

but the separate organizations must be maintained for dealing with special problems.

Mr. Goodwin said his idea was to build up the groups and tie them together by executive committees which would only discuss problems of interest to all. In the States they figured they might bring in about five or six hundred thousand members, and by the contribution of 1/40 of one per cent. of all gross sales, two or three or five or six million dollars per annum would be available. They could then form electrical boards of trade in the various towns and cities to discuss problems and seek to provide proper contact with the public by public lectures. It was almost pitiful, the speaker said, to discuss electrical questions with the average housewife. She is totally ignorant in regard to them. For example, the first question one was likely to be asked was: What is this electricity? Of course that could not be answered and as a result uncertainty arises in the public mind. Then, if one began to discuss engineering questions, the budding Edison of the household might ask: Why 50, or why 60 cycles? And again there is no ready answer. Or one might go down the street and find one merchant selling an iron at \$6.00, another selling it at \$4.00, and another at \$3.50. And so, the public loses confidence in electrical things and electrical people. Therefore the men of the industry must get together and come into agreement as to the story they will tell the public, and all tell the same story and all in the same way. They should not talk with the public in regard to technical problems, but only about merchandizing. If they developed electrical boards of trade and organized a lecture bureau, they could have lectures prepared that would appeal to the public and could have these lectures delivered in every town and city in the country. They could also develop lectures within the trade on trade matters, and could talk about them on the same day, on the same subject, bringing all together, so as to arrive at a solution of a problem. But by present methods, the difficulty was that they were talking on different points. If machines in a power house were to do their work efficiently they must be brought into synchronism, and it was just as necessary that the various branches of the trade throughout the country should be brought into synchronism. It was just as easy to do this as to have engineers struggling with the same problems at 50 different periods of the year. All should discuss the problem at one time and decide what was the best thing to do.

However, the industry had grown in spite of errors of judgment. The forces were working to develop it, in spite of our activity or inactivity. But let us centre our activity along the best known lines and then we would get the confidence of the public because the problems had been treated in a scientific way.

Two Different Problems

Regarding the two problems of energy distribution and merchandizing. In the first case, the problem was in the experimental stage, but in the second case, it was not, for the best practices had been proven in other lines of trade. The trouble arose in the States in the early stages because engineers were appointed commercial managers and they experimented with new ideas by price-cutting and selling-at-cost methods. This trouble was the result of what the speaker termed "minor functioning," for example, the central station going into the retail business, or a manufacturer into jobbing or retailing, or the jobber starting retailing. An unbalanced condition of the industry was brought about. To present this question to the minds of engineers so that they would understand it was the idea he had struggled with for 15 years and finally he had come to the Wheatstone Bridge.

Mr. Goodwin here displayed a diagram illustrating the analogy between the Wheatstone Bridge and the electrical industry, which he proceeded to explain. In the Wheatstone

LIGHT & POWER COMPANY

The Human Wheatstone Bridge—"How particularly appropriate it is that the connections of an electrical instrument best indicate the correct commercial relations in the electrical industry."

Bridge the source of energy was the battery, and this battery was likened to the public, which supplied the energy to the electrical industry in the form of capital. The moment this flow of energy was stopped the industry would cease to operate. Therefore the relation of the public should be one of confidence. Mr. Goodwin proceeded to further explain the analogy between this industry and the Wheatstone Bridge, as follows:

"The battery, the source of energy, represents the public, whose investors furnish the capital for all branches of the industry. This capital, the manufacturer converts into gathering and distributing equipment for the central station or industrial plant or into appliances and supplies. His sales diverge as shown in the diagram, dependent upon the principal class of product utilized by each branch. The central station has electric service as its principal product which, it will be noted, is used through the wiring installed principally by the contractor-dealer. The wholesaler has, as his principal function, problems affecting wholesale electrical merchandising. He makes contact with the central station or the contractor-dealer in passing to the consumer. The contractor-dealer thus becomes the point of retail contact of the manufacturer, central station, and wholesaler with the consuming public which, by the way, following the circuit, brings us back to the negative side of the battery, thus completing the analogy."

Mr. Goodwin said it was not his intention to assert that any branch of the industry should be prevented from entering into the business of other branches, but that each should recognize the principal business of each group and all should get together in synchronism. He did not contend that the idea was necessarily the best for the people of Canada, but he did contend that they should get together on some kind of plan developed from the best ideas of the men of the industry. He also referred to the planks of the "Goodwin Plan" which had been brought out because many had misunderstood the idea. They came to meetings and forgot the good things they

heard, but only remembered the one point that happened to hurt their pocket books or their pride.

Mr. Goodwin believed that before December 31, 1919, they would have completed the plans and specifications for the electrical structure which had been his dream for a great number of years. He thought that in Canada also we recognized the opportunities and were ready to take advantage of them, and he would be glad to do all in his power to help the movement along. It was a great pleasure to him that his work had been of assistance to the Ontario Association of Electrical Contractor-Dealers. He had not gone into the work for personal gain, for his term of enlistment ended in December next, when he was going to sever his connection with the electrical industry and go back to his farm in California, neither had he gone into it for glory, for he had found that when any one attempted to bring a constructive measure into effect, he was subjected to as much criticism as praise. Some day, however, he hoped the dream might be realized of an international electrical organization with a great big object in view—the serving of humanity.

Mr. Goodwin was accorded very hearty applause, and Mr. Buchanan aptly suggested that the terms of his enlistment in the work of the electrical industry should have been the same as those of the soldier in the army—three years or the duration of the war.

Discussion

The meeting was then thrown open for questions and discussion. Mr. Sifton, of Hamilton, asked if Mr. Goodwin had considered whether there should be a clause in agreements that there should be no remuneration for services not rendered—for instance in the case of a wholesaler who did not carry a stock sufficient to give proper service.

Mr. Goodwin said compensation for services not rendered was uneconomic and sooner or later would fall of its own weight. By discussion of the question they would finally reach an idea of service to be rendered by each factor,

and its value. He had been working on a formula for more than seven years which he hoped he would be able to present before the year ended and which would make it possible to measure the value of any given service. When he first presented this scheme to the professors in the University of California they said it could not be worked out, but he had managed to work it into a tangible proposition. Many of our policies, he said, were fundamentally wrong. In the old days in the States, when they were developing the industry and had little knowledge of the problems before them, they had formed organizations primarily for the purpose of price fixing. Now price-fixing had been made illegal in the States. Under that system, which was uneconomic and illegal, they did not attempt to measure the value of services, but arrived at the results in an arbitrary way on the basis of barter and trade, or a give and take proposition, and not by scientific methods. However, consideration had been given to a scientific proposition—price-making. The difference between price-making and price-fixing was that the former took into account all the factors in the industry—manufacturing, warehousing, wholesaling and retail distribution. Here, the speaker referred to the unfair advantage which some jobbers took of the differential they obtained. The jobber receives 40 per cent. on a given commodity and a part of that commodity he sells at 25 per cent. to the dealer and a part he sells retail. In one case the jobber has 40 per cent. while the retailer has only 25. Some kind of system must be developed that each interest shall be compensated at the same rate for the same service. He has a way of doing this but to suggest it would immediately create opposition because the various interests were enjoying unfair benefits. The eventual solution, to his mind, was this—that a single discount on a given quantity of goods should be the same for wholesalers and retailers and that wholesalers be given compensation only for the part of the commodity he sold to the retailer and that he should not be allowed to make this compensation on what he sells to the public. The result of the present policy had been that compensation had been given for services not rendered. The real answer would come when we got a formula just like that for measuring wire. It would be a clean cut proposition for measuring the value of services when we know the value of the work necessary in connection with the various commodities. Bare copper wire, for instance, could be handled at an expense, for warehousing and wholesaling, of about 2½ per cent., whereas ice machines, dish washers and such like, have an overhead of over 40 per cent.

In response to a question as to whether there was an organization in the States for bringing all the electrical interests in the States together, Mr. Goodwin replied that about ten days previous the contractor-dealers had appointed a committee to meet with other groups and discuss the matter with them. He had also attended a meeting of the National Electric Light Association called for the same purpose, and the jobbers had already authorized a committee. Within the next 60 or 90 days it was probable this organization would be formed.

Socialism and Bolseivism

Mr. Yates, of St. Catharines, referring to the plan of co-operation on the analogy of the Wheatstone Bridge, declared that he did not believe this could apply to the Hydro-Electric Power Commission, as they were opposed to all other public utilities, and indeed to every interest entering into the Bridge. They conflicted with the manufacturing interests by the placing of big orders which unbalanced the trade and they clashed with the retailer in the matter of prices. In fact they were "agin the government" every time.

In reply, Mr. Goodwin said he hardly believed Mr. Yates meant just what he said. If he were to take him

literally he would understand the Hydro to be organized along lines of extreme socialism, and with that comes Bolseivism. We had seen a nation—one of the greatest in the world, for we must give the devil his due—destroy itself in four years by that same spirit. "You would build up in Canada," he said, "an autocratic power that would tear itself to pieces. There is no reason why this organization, on the principle for which it stands, should attempt to destroy all privately owned institutions. If I were to take you literally, I would understand that the only reason you are not destroying them is that you lack the ignorance or the courage of the Bolsheviki. You possess that thing which is just as bad—fear."

"Is it not a fact," continued Mr. Goodwin, "that in the past year the Hydro was unable to supply all the power needed for munition work and that the privately owned companies supplied the deficit? In that case your interests did not conflict, as you assert. But I don't for a moment believe you mean what you say or that you're as bad as you try to make out."

Mr. Ireland, Ontario Hydro, agreed with Mr. Goodwin. During the past ten years, he said, they had been trying to work out schemes of retailing, forgetting all the time that it was minor functioning, while their primary function was the generation of electricity. In merchandising they had fallen most lamentably, because they had started out to merchandise goods in the same way as current. They had thought to increase sales by cutting down the price of irons to \$3.50, but the result was the contractor-dealers' sales fell down and less electrical goods were sold. He did not believe they should be opposed to any of the other interests in the industry. He thought the case of Windsor, previously mentioned by Mr. Perry, illustrated this, as Mr. Perry had shown, large increases in sales without antagonizing the local dealers. The supply of current was a natural monopoly, but the merchandising of electrical goods was not. They had started out interfering with other citizens, which they should not have done in any shape or form, and he believed most of them now realized this fact.

Mr. Phelps, of Sarnia, did not think that the central stations should take up retailing on any basis. Their business was to sell current.

Central Stations Can Exploit New Devices

Mr. Goodwin, in reply, said they had tried out all the different ideas in the States, and he did not agree that the best development of the electrical industry would result through the central station keeping out of the appliance business. Merchants, as such, were primarily in the business for profit, and it was not to be assumed that they were going to re-invest all of their profits for the exploitation of an unknown quantity. The electrical business was only in its infancy and within the next 25 years there would be thousands and thousands of new products of unknown merit, which the ordinary dealer could not afford to exploit. As an instance, he mentioned the ice machine. There was no doubt as to the merits of this machine, but the margin of profit was so small that the merchant could not handle it profitably. His idea was this: That the central stations conduct high class retail stores; that they sell their goods on a just basis; that the profits derived from goods of proven merit be set aside for use in the introduction of new devices, on which, due to limited production, there is a small margin. For this purpose, however, the central station could use 100 per cent. of its profits. There were 20 or 30 new devices brought out every year, and once their value had been impressed on the public through the efforts of the central station, the small merchant could then handle them profitably.

Mr. Buchanan said there was no doubt that it was the

part of the central station to exploit new devices. In London they had sold over 700 ranges and he did not think they had made much profit on them, but now the ranges were being sold at standard resale prices and producing a fair profit because the people had been brought to believe that the electric range was the proper thing to cook on. He also suggested that they should not run away with the idea that they were selling devices merely for the purpose of creating revenue. The revenue on an ice machine would be very small, but if it could be marketed at a reasonable price, it would prove a great household comfort, and as a publicly owned utility they should keep the idea of human comfort in view rather than a big load.

Mr. Madden pointed out that it had been necessary for the municipalities to enter the appliance business for the purpose of building up load. During the early days they had to fight considerable opposition, and no doubt they had made mistakes, but unquestionably if the local Hydro stations took up merchandising on sound principles, it would be to the advantage of all concerned.

Mr. Chapman said that quite frequently, in their line of business, they had found it a decided advantage to have the central stations exploiting high-priced electrical stuff.

The discussion being closed, a hearty vote of thanks to Mr. Goodwin was unanimously passed.

Mr. Scott moved an amendment to the constitution as follows: To the clause "Commercial members shall not hold any office," there should be added, "except as members of committees."

Officers for 1919-20

President, O. F. Scott, Belleville.

Vice-president, M. K. McHenry, Walkerville.

Secretary, S. R. A. Clement, Toronto.

Treasurer, R. C. McCollum, Toronto.

Division vice-presidents: Niagara, P. B. Yates, St. Catharines; Central, W. E. Reesor, Lindsay; Eastern, H. F. Shearer, Smith's Falls; Northern, R. H. Martindale, Sudbury; Georgian Bay, E. J. Stapleton, Collingwood.

Papers Committee: H. H. Couzens, Toronto Hydro, chairman; L. G. Ireland, Ontario Commission; E. V. Buchanan, London Public Utilities Commission; A. B. Cooper, Canadian General Electric; C. H. Hopper, Canadian Westinghouse Company.

Conventions Committee: V. S. McIntyre, Kitchener, chairman; E. I. Sifton, Hamilton Hydro; R. T. Jeffrey, Ontario Commission; Geo. C. Rough, Packard Electric Company, St. Catharines; J. W. Bailiss, Niagara Falls.

Rules and Regulations Committee: A. T. Hicks, Oshawa, chairman; T. C. James, Ontario Commission; E. H. Porte, Renfrew; R. H. Stafford, North Bay; H. F. Strickland, Ontario Commission.

On a vote being taken it was decided to hold the next convention in June, at Niagara Falls.

A contract has been awarded to the Canadian Westinghouse Company for the supply of two generators for the Hydro-electric Power Commission of Ontario, for installation at Queenston, on the Chippewa development. Each of these turbines has a capacity of 45,000 k.v.a., operating at 187.5 r.p.m.

"The doctor says I am working too hard."

"I'd put more faith in that diagnosis if it came from your boss."

Sherbrooke Plant Has Successful Year

The city of Sherbrooke have just issued a comprehensive and very gratifying report of the operations of the electricity and gas services of that municipality for the year 1918. The report also includes figures covering ten years of operation of electric energy supply under municipal control. During the past year the revenue was \$286,609.60 in the electric department as against an expenditure of \$136,317.25, leaving a balance of \$150,292.35 to transfer to depreciation and profit and loss accounts. The gas service showed only a small deficit. During the past ten years the total value of Sherbrooke's municipal plant was increased from \$35,365 to \$2,151,390; the surplus from \$99,190 to \$684,281, and the yearly revenue from \$9,437 to \$111,118. The generating capacity, with the addition of the latest plant at Weedon, is approximately 6,000 k.v.a. Regarding the power factor of the system the report has this interesting item:

"The power factor of the system was determined by test at 65 per cent. and it is evident that if this power factor had not been corrected by the use of synchronous motors, the plants of Rock Forest and Frontenac Street would have been only able to generate 65 per cent. of their generating capacity at 100 per cent. power factor or 65 per cent. of 4,200 kw., equal to 2,730 kw.; instead of this, and after having raised the power factor to 88, we were able to sell 88 per cent. of the generating capacity of both plants, being 3,700 kw. It was also possible to carry a load of 4,200 kw. with a power factor of 85 per cent. without exceeding the 25 per cent. over current guarantee of the manufacturers. From the above, the result is that the power factor correction has enabled the department to sell 970 kw. which could not have been obtained from the system at 65 per cent. power factor; and this was done without overheating the generators. In addition to this, the correction of the power factor has enabled the Department to establish a system of automatic voltage regulation far superior to the one in use up to this date.

"The by-law No. 373, containing the clause stating that the power factor should be maintained at 85 per cent. by the customers, the correction of this power factor on the various accounts of these customers brought the total sum of \$7,428.00 from the 1st of June to the 31st of December."

The financial statement is signed by B. Arthur Dugal, secretary, and the report of the operations of the electric department, by C. J. Desbaillets, manager and engineer.

Obituary

Mr. W. K. Greenwood, chief engineer of the Orillia Water, Light and Power Commission, Orillia, Ont., died recently of Spanish influenza. Mr. Greenwood was a graduate of the Faculty of Applied Science and Engineering of the University of Toronto, in the class of 1904; a member of the Engineers' Club, Toronto; an Associate member of the Engineering Institute of Canada; an Associate of the American Institute of Electrical Engineers and was well and very favorably known in engineering circles.

The death occurred on February 2nd of Hydro Commissioner Col. William K. McNaught, C.M.G., Toronto, at the age of 74 years. He was president and manager of the American Watch Case Company, but, despite the demands made upon him by this business, was prominent in varied industrial and development projects. He had been president of the Canadian Manufacturers' Association, a member of the Ontario Legislature, chief executive of the Canadian National Exhibition and an active and enthusiastic member of the Ontario Hydro-electric Power Commission since 1906.

The Contractor-Dealer

We May As Well Face the Facts: We In the Electrical Business Are Not Merchants Yet, But We Are Not Too Old To Learn

When all is said and done we are forced back to the one conclusion that "merchandising" is the big word in the electrical industry to-day. What is the use of manufacturing if we can't sell?

And the next fact we must face is that electrical men are among the poorest merchandisers in the world.

Under the circumstances there is only one thing to do—we must **learn** the merchandising business. Presumably it is no disgrace that we find ourselves in this position, but it will be disgraceful and quite unpardonable if, knowing the plain facts, we do not busy ourselves to remedy conditions. Electrical goods, up to the present time, are being sold either by central stations which are, for the most part, in charge of engineers, or by contractor-dealers who have not yet been able to forget that they were contractors before they were dealers, and still look upon this part of their business as the most important. What chance then have such inexperienced merchandisers in competition with the experience of hundreds of years in other lines of trade, and what wonder that hardware men, druggists and retailers in other lines are invading the electric man's field—and making a success of it, too. Why? Because they **know** the merchandising business.

When Mr. Goodwin was in Toronto on January 30-31, he spent part of an afternoon visiting some of the retail stores and, in the evening, when he met the contractor-dealers he gave them a criticism on what he had seen. In the main his advice was—employ a competent man who has the necessary knowledge and experience to take charge of your store and leave it to him. He described how similar conditions to those existing in Toronto and most eastern cities had been improved by the appointment of a Health Committee, whose duty it was to visit the different stores regularly and see that they were sanitary and wholesome—otherwise report them to the city health department. He pointed to the futility of publicity in connection with most electric stores—no well dressed woman would care to go into them for fear of soiling her clothes. In consequence people got the idea that electrical appliances were messy, dirty and untidy, instead of the reverse, which was the fact.

The speaker pointed out how necessary it is that every contractor should also be a dealer. Contracting in itself is not and never can be, a "business." It is merely a means to an end. So many uncertainties are associated with wiring jobs that they will always remain more or less of a gamble. Merchandising electrical goods, on the other hand, can be placed on a thoroughly sound and scientific basis. The contractor-dealer must learn to sell the electrical appliance idea, the picture of the well equipped electrical home, for example, rather than the mere bits of wire running up the walls. Wiring is a mere incidental in the outfitting of the electric home, absolutely devoid of interest to the owner. Mr. Goodwin's advice was that the contractor-dealer should

forget, as far as possible, that he is a contractor and remember only that he is a merchant.

Incidentally, it was pointed out, there is more money to be made in selling electrical goods than in wiring buildings.

The price of an electrical appliance is not a big factor in its sale. Much more depends upon its proper demonstration. In many localities the larger appliances must be sold on the instalment plan and the Association, as a body, should endeavor to make arrangements with some bank or other financial institution for discounting these instalments, otherwise the investment charges are beyond the reach of the average contractor-dealer.

Mr. Goodwin described a number of "kinks" he had worked out on the Pacific United States coast to keep the various sections of the trade wide awake and working in unison. For example the contractor-dealers had a chart showing the attendance of the members at their meetings. This was photographed monthly and copies were mailed to the various jobbing houses so that these may be in a position to know which of their customers were taking an interest in their business as shown by attendance at meetings—and who were slackers. The same scheme was followed with respect to dues paid and owing to the Association. If a man was behind with his dues he naturally was not as good a credit risk as the man who made prompt payment. A standardized accounting system was also recommended, not only because it was essential that each dealer should have a proper system of accounts, but also for convenience of reference when the jobber was considering the amount of credit a man may carry. When the industry became properly organized it should, perhaps, become the duty of a jobbing house to see that their customers all used an accounting system so nearly identical that judgment and comparisons could be made without waste of time or danger of error and credit should be refused to all contractors who failed to install and operate such a system.

Shall the Central Station Conduct a Retail Store?

Perhaps the one question, more than any other, that members of the electrical trade were anxious to hear Mr. Goodwin's opinion on was: should the central station retail electrical goods? And the answer was absolutely definite—"By all manner of means." Mr. Goodwin hastened to add, of course, that the central station must, however, respect the laws of good merchandising. No price-cutting; no selling at cost. That was unfair competition and consequently bad business. Therefore, sooner or later such a procedure must end disastrously.

There is no evidence in sight that the competition among the various electrical stores is so keen as to cut into the business of any of them. Indeed, the contrary appears to be the experience, i.e., that the more stores there are, the more general information is handed out to the consumer and in consequence the more goods there are sold. The merchandising of electrical devices has not yet approached the saturation point and, according to statistics on areas that have been most thoroughly worked over, the average district will ab-

sold about ten times the value of electrical devices now being sold to the consumer. Plainly, therefore, the competition of the central stations is a matter of merely infinitesimal importance compared with the possibilities for increased business by enlisting their assistance in advertising campaigns and in pioneering—granted always, of course, that the central station learns how to conduct a merchandising business and follows recognized sound practice.

The value of the co-operation of the central station is seen most, and their function is more clearly defined, in the exploiting of new appliances. Mr. Goodwin instanced the case of washing machines which the public had at first been slow to appreciate the value of. It was quite beyond the capital means of the average contractor-dealer to stock and exploit a number of different makes of washing machines, but quite possible for the central station. As soon as this machine became a recognized part of the electrical industry the dealers took it up and left the pioneering work of some other article to the central station. While Mr. Goodwin admitted that the primary function of the central station was to sell electric current, on which business the income properly depended, he contended that there was also a secondary function of merchandising which should not be conducted for profit, but still should carry its own capital charges. The only difference between a central station shop and a private contractor-dealer's shop would be that the profits of the former should be put back into the exploitation of new devices. This he considered a perfectly proper and correct attitude for every central station to adopt.

The Open Bidding System

What do you mean by the "open bidding system"?

This question at the contractor-dealers' meeting on Friday evening, January 31, in Toronto, brought Mr. W. L. Goodwin to his feet with an exclamation and something like an execration: "Not know what open bidding means? Why man you are twenty-five years behind the times. Do you mean to tell me you have none of you ever tried out the practice of open bidding?"

Briefly described, this system works as follows: Suppose a half dozen contractors, A, B, C, D, E, and F, are bidding on the same job. They first appoint a disinterested party, X, who will act as a clearing house for the bids. Then as each contractor sends his tender to the owner he also sends a copy to the clearing house, X, i.e., the confidential clerk X will have in his possession copies of the bids of A, B, C, D, E, and F on this certain piece of work. The work of X now consists of making five copies of each of the bids and, (with or without disclosing the names of the bidders as may be mutually agreed), distributing to the various contractors. For example A's figure is mailed to B, C, D, E, and F. B's figure is sent to A, C, D, E, and F and so on. Each contractor thus has the other five bids in his possession for comparison with his own.

Sometimes the practice is merely to exchange totals. In other cases the various items are freely exchanged so that each may check up his own figures and see where any error has been made. Frequently an error resulting in too low a bid has been located by a competitor in time to have this bid withdrawn or corrected and so prevent a loss to one of the contractors.

An exchange of bids in this way may occasionally result in one or other of the contractors submitting a lower bid, but Mr. Goodwin stated that in his experience this was a rare occurrence. In such a case where, for example, A decided to change his bid, he merely advises X who passes the new figures on to B, C, D, E, and F.

This plan was originally devised to protect the electrical contractor from the general contractor or the architect. For

example it has frequently happened that the man who already has submitted the lowest tender, (but doesn't know it), is called aside by the architect and told: "We'd like to accept your bid but you are just a little bit high. Now if you could drop \$200 we could fix you up"—and you have fallen for it because you were in the dark about the other bids. With the "open" system you yourself would have just as much information as the architect or the general contractor and could not be made a tool of. Another advantage of the open bid is that the various contractors soon begin comparing notes as to the method of arriving at their figures. In this way false formulae are detected and the whole problem of preparing estimates is placed on a scientific basis. Instead of bids on a \$3,000 job being \$500 apart they would scarcely vary by \$50 when each contractor followed an established system of computing charges.

In this system of open bidding it is to be understood, of course, that no member of the contracting trade gets copies of bids unless he has himself submitted a tender and handed in his figures to the clearing house, X.

A dozen Toronto contractor-dealers signified their willingness to try out the plan and it will be put into effect forthwith.

Manufacturers and Jobbers Organize

Canadian manufacturers and jobbers are taking steps to organize separate associations to work in with the Goodwin plan of co-operation. On Friday evening, January 24, a joint meeting of manufacturers and jobbers was called in the King Edward, Toronto, at which the question of the best form of organization was fully discussed. Mr. C. A. McLean, manager Masco Company, presided. Finally two committees were appointed—one from the manufacturers, the other from the jobbers—who were separately required to bring in a report and, in the meantime, get in touch with those members of the trade who had not been able to attend the meeting. It was also decided at this meeting that an invitation be extended to Mr. W. L. Goodwin to address them at some convenient hour during his visit to Toronto, to attend the convention of the Ontario Association of Municipal Electrical Engineers. Money was voted on the spot to cover incidental expenses and the committee became active at once. Manufacturers and jobbers outside of Toronto were communicated with and prominent advertisements inserted in the daily papers.

Various committee meetings were held during the following week so that by Friday, the 31st, everything was in readiness for Mr. Goodwin's visit. The meeting was called for the afternoon in the Board of Trade assembly rooms and a thoroughly representative attendance indicated the interest that had been aroused. The chair was taken by Mr. M. K. Pike, general sales manager Northern Electric Company. Mr. Goodwin spoke for two hours of the advantages of co-operation of the various elements in the electrical trade—which pre-supposed organization—and outlined in detail the Goodwin plan.

Following the address and a brief discussion, the members expressed themselves ready for organization and the manufacturers and jobbers retired to separate rooms. The members of the jobbers' section were unanimous in their opinion that an association should be formed and appointed a committee to prepare a tentative constitution and offer suggestions for the general working out of the scheme. The committee consists of Messrs. M. K. Pike, (Northern Electric), chairman; L. O. Horner, (Canadian General Electric); C. A. McLean, (Masco Company); M. S. Pierce, (McDonald & Willson), and two members to be named by Montreal jobbers. This committee will report at a time and place not yet determined.

The manufacturers also were of the opinion that the time

was ripe for an association and appointed a committee consisting of Messrs. R. E. Callahan, (Majestic Electric Company), chairman; F. John Bell, (Canada Wire and Cable Company); William Mulveney, (Canadian Tungsten Lamp Company); C. F. R. Jones, (Northern Electric Company); Dan. Logan, (Sunbeam Lamp Company); J. E. Pelletier, (Solex Lamp Company); Frank T. Groome, (Benjamin Electric Company) secretary, and J. Herbert Hall, (Conduits Company Limited). This committee will also draft a constitution and rules of procedure and report at a later date.

Electric Merchants As Seen By One Who Calls on Them

"The Merchants among the people shall hiss at thee. Thou shalt be a terror, and never shalt be any more."

That is a text for most contractor-dealers and while it is biblical it is not a lamentation of a "Stickit Minister" or a "Jeremiah." It is for you who call yourselves merchants among merchants—who not only say: "We can't sell electrical appliances," but worse still, act (if you you do not say it). "We won't sell appliances." Yet, all the time you act thus you carry the appliances in your stock, and the great bulk of you, even in the Canadian metropolitan centres, have all the stereotyped excuses:

"The jobber or manufacturer does not give sufficient protection."

"The central station does not play the game."

"The departmental store cuts the prices."

In the face of all this we find the brilliant exception, to whom the text does not apply in Sault Ste Marie, Hamilton, Peterboro, Kitchener, Sudbury, London and, fortunately a few others. All these successful vendors of electrical appliances have one prerequisite in common—sufficient capital and credit to make the game go. Granted credit is not the only essential yet without it the most brilliant plans, the best merchandising schemes, all your tact push and principle will not win out.

Assuming then that you who are not successfully selling appliances can command sufficient credit—what ails you?—Some one or all of the following:

You are afraid to advertise,

You are afraid to invest in suitable and attractive shop fixtures,

You are afraid of reasonable rents,

You are afraid of your jobber,

You are afraid of the public,

You are afraid of yourself, or

You don't understand the first essentials of merchandising—you are a misfit in this business.

Before discussing in detail practical ideas for selling appliances which you retailers can put into effective practice with a minimum of effort, let us get down to some basic principles. If with all these successful examples in Ontario, (with no more credit than you have) you cannot alone conquer your fear, your case is hopeless,—to those of you who are not afraid, these messages are directed:

Move your office and shop from the back street to a spot where the traffic and transient trade is denser. Put in an attractive front and get your goods in the window—not your whole stock (the conglomerate mess that some of you show) but a pleasing and discriminating rotation of stock. Dress up your store and, just as important, dress up your young men—clean linen (even if frayed), shined shoes, (even if patched), manicured nails (even if trimmed with a scissors),

clerks that can speak reasonably decent English, active, pains-taking, polite, ambitious, careful, forceful, clean young men, preferably between the ages of 17 and 20, who have matriculated or spent some time in the High School and a year in overalls as a wireman's apprentice, or in the assembly or shipping-room of a jobber. Quite likely, at your start, you need only one; the woods are full of such youngsters. All you have to fear from these coming merchants is that they will own your store or their own competing establishment some fine day.

Having done all this, deal with responsible jobbers who furnish data, literature and mechanical helps to the retailer—jobbers who handle recognized and reputable irons, toasters, percolators, chafing dishes, ranges, table stoves, sewing machines, washing machines, dish-washers, portables, heaters, unit package fixtures, counter sale fittings, vibrators, fans, lamps and the hundred and one items that are profitable and which the public has long since been educated to buy and use.

Don't mix your "dealer business" with your "contractor business." Know absolutely the separate overhead on each. Know what your fixed investment should be by months and seasons. Know how many times a year you must turn over your entire stock. Engage an accountant to conduct a running audit. If you begin in a small way you can have this done for about \$10.00 a month. I know one very successful dealer-contractor in a town of 20,000 population who started on less than \$1,000 capital, who conducted a running audit for \$5.00 per month the first year and even now, after six years in business, with an annual turnover of \$60,000, has a running monthly audit for less than \$150 per year. And this same dealer-contractor established all the credit he needed both with the bank and jobbers, principally by sending his creditors every six months—unasked—a certified statement, showing his exact standing, with a copy of his inventory.

The credit manager of any responsible jobbing house is your very best friend. He will open your books for you and coach your bookkeeper. He will advise you how to determine your overhead and your required turnover. He will willingly assist you to analyze your auditor's statement. He will co-operate in every sense of the word and he has nothing to sell you but his services, and the cost of this service is in the legitimate cost of your electrical goods. He is working with you on a reciprocal basis for his own house, and he wants you to succeed. I know a credit manager of a large jobbing house who makes frequent trips to several towns to go over the books and accounts of several contractor-dealers at their invitation. He constantly educates them to discount their bills, to get in their collections, to develop a cash business. He almost makes the sales manager's life miserable importuning him to study the retailers' end so that the contractor-dealer shall grasp at once all the best ideas for moving his appliances.

Unless you are going into the contractor-dealer business on the foregoing principles, your stock of one-half dozen irons will increase to twice their invoice price by the time you must give them away. Your washing machine will tarnish and rust, your vacuum cleaner bag will be moth eaten, dissolution will finally set in in the contractor end of your business and you will rot away. **You become a carpet bagger**—and "The merchants among the people shall hiss at thee."

The Ontario Safety League, Royal Bank Building, Toronto, have issued their fifth annual report, being a brief statement of the fire and accident prevention campaign conducted during the year 1918. The booklet also contains a preliminary report of the Canadian National Safety League, Inc.

Introducing Co-operation Into Competition

One of the new ideas to be introduced by Toronto Electrical Contractor-Dealers is the open price bid. This is referred to briefly elsewhere in this issue, but a more complete explanation of the plan was recently given before the Boston Association of Contractor-Dealers, by Dr. Henry R. Tosdal. Extracts from this paper are given below.

During the past few years, there have been great advances in the way in which men act and feel toward each other. It has been impressed upon us more than ever that we have common interests, and in particular trades there has grown up a greater sense of interdependence. We find the members of the trade co-operating gladly with the Government for the attainment of Government aims. We find that, in such co-operation, the men in the trades have become better acquainted with each other and have learned that the competitor is a much different man personally from what they had supposed him to be. We are learning gradually that the purpose of true competition builds up a trade, while cut-throat competition destroys competitors.

The electrical contractors of New York have tried out the open price plan and have been converted from skeptics to enthusiasts in the course of a comparatively short time.

Briefly speaking, applying to electrical contractors the plan is as follows: Each contractor sends a copy of each bid to a central and impartial agency; bids are exchanged between those bidding on the same contract. Arrangements are made so that a contractor's bid need not be exchanged until after the contract is awarded. The contractor who does not wish to have his bid exchanged among other bidders will not receive information as to the other bids.

When the contract is awarded, the successful bidder notifies the office, and the information is sent to the other bidders. That closes the history of that particular bid, except in so far as the figures appear in the general statistics issued at the end of each month.

There are numerous advantages to the contractor in the open price organization. First, through the operation of the plan, the old attitude of suspicion and secrecy is completely done away with. Instead, there appears an atmosphere of frankness and openness, which renders business much more pleasant to transact, but which does not do away with healthy rivalry of competing concerns. Each member knows whether or not his share of the business is increasing or decreasing. Further, if a contractor finds that there is an unusual difference between his bid and someone else's, it may cause a thorough re-examination, which has not infrequently led to great saving through the discovery of mistakes in estimating. More important is the information that the contractor secures with regard to the general range of bids, which protects him from misrepresentation on the part of general contractors or owners as to the amount of competitors' bids. Under this plan it becomes impossible for the general contractor to go to the low bidder and tell him that he can have the contract if he shades the price. In more general terms, the contractor proceeds upon the basis of true and accurate information, instead of upon the basis of rumors or insinuations or plain lies of those who are interested in beating down the price.

In the long run, the contractors or producers in general cannot control the forces of supply and demand. Stability by agreed prices is not sound; in fact, it is impossible. Stability can be secured only by each contractor or manufac-

turer making his own prices independently, but on the basis of reliable information.

The open price association furnishes this information promptly and accurately to members. It deals only with past transactions and is, therefore, in full accord with existing law, as well as in accord with economic law. However those in charge of the operation of an association must have an intimate knowledge of the open price plan, its working and its results, the law regarding it and trade association matters in general. Further, for the best utilization of the information, statistical experience is extremely desirable. In order to secure such experience several open price associations may be operated by one specialized organization more economically and more efficiently than if a full organization were provided for each one.

To me the future to the open price plan, or rather of co-operative competition, appears very bright indeed. It is a practical plan which gives the benefits of both competition and co-operation; the resulting stability is for the benefit of the contractor-dealer and consumer. A prominent business man has recently declared that, in the course of the next few years, all business would be conducted under the plan. Though that is perhaps too broad a statement, one may safely assert that in few lines of trade as yet have its possibilities been fully realized.

Illumination for Night Construction

The illustration herewith shows night illumination at the Quaker Oats plant, Peterboro, recently rebuilt, where continuous construction was carried on. The current supplied for the light and power in the re-construction of this plant was available from the company's own power house, situated on the Otanabee River, about 2,000 feet from the building site. The artificial illumination for the night work on the concrete storage tanks and work house was accom-

Building Quaker Oats Plant—Night Work

plished by the use of 60 watt Laco tungsten lamps, attached to the moving forms about ten (10) feet above the floor line. These lamps were spaced approximately ten (10) feet apart on the tank forms, and eight (8) feet apart on the work house. No reflectors were used and the general result obtained was quite satisfactory.

For general illumination around the building site at night Davis flood lights, with 1,000 watt Laco nitrogen lamps were used.

How I Increased My Sales 100%

On Friday night, when the contractor-dealers of Toronto were in session, Mr. Goodwin threw in a few bombs just to make the members sit up and take notice. He told them that "selling" is largely a matter of psychology, (whatever that is). For instance, you can't sell an electric appliance to a woman at the door; she won't listen to you. On the other hand she will answer the telephone and talk to you by the hour. All women enjoy talking on the telephone, according to Mr. Goodwin. Also he says the proper time to sell a washing machine is Monday, (or Saturday, in preparation). Tuesday is no good and by Wednesday the housewife is positively set against them. Tuesday is the day for irons. The evening hour, seven to eight, is the best time to talk lamps, and so on.

Goodwin is right. There's a time for everything, even in selling electric goods and dealers are every day doing just as foolish things as the man who was advertising electric heaters on July 15 with the temperature at 85. Everything depends on catching your prospect at the right (I mean psychological) moment. And here's a little story of my own to prove it.

Not many months ago the spare time of my wife (and of many other good men's wives), was given over to Red Cross work—sew, sew, sew, till their legs and arms and eyes ached again. One day I looked in on them to see my wife about some little matter and here they were, a dozen or more of them, treadmilling away as if their lives depended upon it, (as in fact perhaps they did). Well you can imagine my first thought—why not an electric motor to operate these ma-

The other machines were neglected, but the electric was overworked

chines? And you can understand that, being some wide-awake salesman, I lost no time in having one sent up on trial. Of course the natural thing happened—every woman in the bunch tried it out and finally my wife reported that the other machines in the "party" were being neglected and the electric motor was being operated every minute of the time.

I know for a fact that I have since supplied sewing machine motors in four of the homes of those Red Cross workers and have no doubt other sales have been made as the indirect result of my bit of timely advertising. All these machines needed was a chance to sell themselves—they didn't need any talk from me, which all just goes to show the value of a knowledge of "psychology" on the part of a salesman. Like electricity itself, we don't need to know what it is, if we only know how to make use of it.

The Telephone City Electrical Club, Brantford, have re-elected the following officers for another year: President, F. Webster; vice-president, A. C. McLean; secretary, W. E. Lemon. Meetings are held the first and third Tuesday of each month at the regular club rooms.

Trade Publications

Condulets—Suggestion No. 39, by the Crouse-Hinds Company of Canada, illustrating types FSCC and HHC condulets for the control of circuits connected to loop installations. Both permit the fuses to be placed at any desired height from the floor.

The Harvey Hubbell Company of Canada, Limited, are distributing an interesting folder entitled "Reasons Why." This folder explains why manufacturers of the better class of portable devices have used Hubbell plugs for years as standard equipment. A number of devices are illustrated.

The Devoe Electric Switch Company, 414 Notre Dame Street West, Montreal, have issued a new catalogue of 100 pages. This is very fully illustrated and contains details, with prices, of knife switches, panel boards, switch boards, formed steel boxes, wooden cabinets, and other electrical specialties. The catalogue is well printed, and will be of value to dealers and others in the electrical industry.

The Cutter Company, engineers and manufacturers, Philadelphia, have issued an interesting folder entitled "I-T-E Circuit Breakers—Then and Now." Splendid illustrations, are also enclosed of the I-T-E- three-pole, double-throw circuit breaker, 8,000 ampere capacity, for alternating current service, motor operated for remote control; and of the 20,000 ampere breaker, single-pole, solenoid operated, remote control.

Personals

Mr. F. W. Pennock, who for the past eighteen months has acted as electrical engineer to the Imperial Munitions Board, has rejoined the R. E. Cleaton Company, Montreal, whose business has recently been incorporated under the name of Cleaton Company (Canada) Limited, and will act in the capacity of general manager.

Mr. H. H. Boyd has been appointed assistant chief mechanical engineer of the C. P. R. He is a graduate in applied science of McGill University, and has been with the C. P. R. in several engineering capacities, including assistant electrical engineer and electrical engineer for the Western lines, at Winnipeg. In 1915 he was appointed superintendent of the Vancouver division, a position he now vacates to reside in Montreal.

Mr. Ronald H. Starr, B.A.Sc., has been appointed engineer in charge of the electric and water plants at Orillia, Ont., succeeding the late Mr. W. K. Greenwood. Mr. Starr is a graduate of the Faculty of Applied Science and Engineering of the University of Toronto, 1908, taking the post-graduate course the following year. He was for over six years with the Toronto Hydro-electric Commission and for the past two years with the Moloney Electric Company. He will take up his new duties about the middle of March.

Mr. E. T. J. Brandon and Mr. E. V. Buchanan have left for England on business of the Hydro-electric Power Commission of Ontario. Mr. Brandon is chief assistant electrical engineer to Mr. Gaby, chief engineer, and has made a specialty of power house, switching station and sub-station design. He is also chiefly responsible for the specifications of the new 45,000 kv.a. generators to be used on the Chippewa development, for which the contract has just been let. Mr. Buchanan is manager of the London municipal electric system, one of the most efficiently organized and best managed in Ontario. During the past year he was president of the Ontario Association of Municipal Electrical Engineers, which has met with such splendid success.

Four million metal discs have been ordered by the Boston Elevated Railway, to take the place of pasteboard tickets.

CURRENT NOTES

Hamilton, Ont.

Hamilton Street Railway receipts for the last quarter in the year 1918, amounted to \$188,003, a decrease of \$13,744 over the same period in 1917.

The Hamilton Radial Railway Company have resumed service between Hamilton and Oakville at the old schedule of rates, pending further developments.

Kingston, Ont.

The Kingston Street Railway Company have announced that no more conductorettes will be engaged and that the services of those at present employed will be dispensed with and their positions given to returned soldiers.

London, Ont.

It is rumored that the London Street Railway Company will offer to sell out to the city as an alternative to their request for higher fares. The franchise expires in 1925.

Montreal, Que.

Fehr Brothers and Little, electrical contractors, Montreal, have registered.

Moosomin, Sask.

The town council of Moosomin, Sask., have under consideration the installation of an electric lighting plant to be purchased some time during the current year.

Newcastle, N.B.

The town council of Newcastle, N. B., is considering the possibility of a water power development to supply cheaper power for local needs. The most favorable site is at Ledden's Landing, on the Sevgole River, a tributary of the

Miramichi, where a thirty foot dam would, it is estimated, provide for a development of about 500 horsepower.

Ottawa, Ont.

The Ottawa Electric Railway Company have made an offer to sell to the city at a figure of approximately \$6,500,000 and has given an option until May 1. This price covers all the holdings of the company, including Britannia Park and the Rockcliffe right-of-way.

Regina, Sask.

A bill empowering the cities of Saskatchewan to operate one-man cars, provisional upon securing the assent of the electors at the polls, has been passed by the Saskatchewan legislature.

Rocanville, Sask.

The town council of Rocanville, Sask., will secure figures on the cost of installing an electric lighting plant.

St. Catharines, Ont.

The Barrett Electric Company, St. Catharines, Ont., have sold out to A. J. Desaud.

Toronto, Ont.

Although the Toronto Railway Company carried 166,510,326 passengers in 1918, as compared with 158,087,894 in 1917, and although, as a consequence, it increased its gross income by \$234,543, it has a surplus from the year's operations to carry forward of only \$21,569, after paying a four per cent. dividend, whereas in 1917 it had a surplus of \$134,810, after paying an eight per cent. dividend. In 1917 the gross earnings were \$6,291,750; operating and maintenance costs \$3,815,278; net earnings \$2,476,481. In 1918 the gross earnings were \$6,526,302; operating and maintenance costs \$4,509,651; net earnings \$2,016,651.

A Time and Labor Saving Screw for Electrical Contractors Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

Special Meeting Toronto Section A.I.E.E.

On the occasion of the convention of the Association of Municipal Electrical Engineers, on January 30 and 31, the Toronto section of the American Institute of Electrical Engineers held a special meeting in Room 22 of the Chemistry and Mining Building, University of Toronto, on January 31, at 8 p.m. The paper was entitled "Recent Advances in Illumination," by Mr. J. F. Heffron. Mr. Heffron has been associated with one or other branch of illuminating science for a number of years and has made a profound study of the subject. His paper was illustrated by slides.

"How To's," by the Society for Electrical Development

Dealers sometimes overlook the fact that in many cases women prospects who are uncertain or timorous when it comes to buying because of a fear that the appliances won't stand up, that the heating element will get out of order or require frequent replacing.

In this connection it is wise to convey to each prospect the knowledge that practically all heating devices are manufactured today under special license, in accordance with the most rigid requirements laid down by the Fire Underwriters, and that the great electrical interests of the country cannot afford to have any woman displeased; if she will just remember that it was only a few years ago when she had the same uncertainty about her incandescent lamp and contrast that feeling with the security and comfort that she enjoys today, she can be made to understand the extent of the development in electric heating units.

All electrical heating devices are liberally "guaranteed" in the sense that should fault or flaw develop the purchaser is safeguarded by the maker against loss. Dealers should add their own voice to the manufacturer's.

Interesting Window Stunt

A Western contractor-dealer, who was desirous of building up an increased "Service and Maintenance" business,

tried out the stunt of putting a repairman in his window. The window was large enough to include a good sized work table and the necessary accessories. The workman repaired irons, cords, etc., in full view of the passerby. On a certain day the proprietor announced that he would overhaul without charge every electrical iron brought to his store on that day. The result was an influx of irons, many of which were not at all damaged. Those that were too much injured for easy repair he explained to the owners that it would require some time and would be an extensive job, necessitating return of the iron to the manufacturer, but that he had arranged with the maker to make an allowance in this particular case and it would not cost the owner anything. He had previously gotten in touch with an iron manufacturer and arranged to furnish that manufacturer a rough analysis of his product in that city. By advertising in this way the dealer found out about how many of the company's old irons were out of business, how the people like them, and how they were standing up, as well as just what was the principal trouble with the iron in question in that locality. This was a help to the manufacturer, and a good advertisement for the dealer.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

==DENZAR==

is a timely proposition for
Electrical Contractors
and Dealers

DENZAR is exactly the unit that offices, plants, schools, etc., in your locality, need. DENZAR utilizes the high-powered rays of the Mazda C lamp, diffuses them properly and produces maximum illumination on the working plane. DENZAR is the ideal unit for correct illumination because it relieves workers from eye-strain by eliminating glare and distracting shadows—the two biggest causes of poor quality work, slow production, accidents and spoilage.

Important to Dealers

Mr. Dealer: You should concentrate your efforts on DENZAR. Many of our dealers tell us that the greater part of their business is DENZAR business. Dealers who are taking advantage of the business-getting cooperation that we are furnishing to them—and will be glad to furnish you—are finding DENZAR a big profitable proposition. Write to us today. Find out all about DENZAR and our business-getting plans.

Solderless Connection

Insulating Shell and Cap

Patented Canada 1917.
Patent Pending U. S.
and Foreign countries.

Ring Out The Old Ring In The New

Ring out the old troublesome method of making connections; Ring in the new Walger way—for it saves 80% of your time.

The WALGER INSULATED WIRE CONNECTOR does away with blow torch, alcohol, solder, acid, rubber, tape and paste. All that is needed to make the connection secure is a screwdriver. Wireman can carry enough connectors in his pocket to to wire up the fixtures for a whole house, and having them connected the Walger way eliminates the danger of defacing walls or ceilings, or soiling fixtures. Makes inspection **sure** and easy. Approved by Underwriters' Laboratories, Chicago, and Hydro-Electric Power Commission, Ontario, Canada. For No. 12 wire and under.

Ask your Jobber for prices and discounts or write

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL

The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"

Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"

Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"

Fire-resisting paint, or colorless solution.

"ARMACELL"

Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"

Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"

for coloring electric lamps. Used in the Royal Navy. Weather-proof. Dries rapidly.

"ARMABRON"

Bitumen protective paint, elastic, acid-resisting, weatherproof.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

**Nos. 346 and 348 Broadway, New York City,
U. S. A.**

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating informa-
tion no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamil-
ton, Ont.; London, Ont.; Montreal, Que.;
Ottawa, Ont.; Quebec, Que.; St. John, N.B.;
Toronto, Ont.; Vancouver, B.C.; Victoria,
B.C.; Winnipeg, Man.; Calgary, Alta.; Ed-
monton, Alta.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:

"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

SQUARE D SWITCHES

**As Long as One
Open Knife Switch
Remains, Your
Plant is Unsafe**

IF there are *any* open knife switches in your plant an accident is likely to happen.

And *one* accident may cost more than a complete installation of Square D Switches which would have prevented it.

Square D Switches do more than eliminate accidents and liability.

The care-free operation permits operators to give undivided attention to their work, which promotes production. The quick action protects equipment.

Leadership

A few years ago, when others were deriding the idea of making a fuse renewable without sacrificing safety or accuracy, the makers of

ECONOMY renewable FUSES

took the lead in accomplishing the "impossible". The "Drop Out" Renewal Link afforded the true solution of the problem. It instantly restores a blown ECONOMY Fuse to its original efficiency. The arc is smothered without the aid of powdered fillers. Anyone can replace the link and renew the fuse in a jiffy.

No other form of renewal element has yet been devised which approximates the efficiency of the "Drop Out" Renewal Link. Hence the leadership of the ECONOMY among

renewable fuses becomes daily more pronounced.

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

Renewable Fuses

FOR ELECTRIC LIGHT AND POWER

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

Free Samples If You Write Today

A. F. DAUM, Sole Mfr., Pittsburgh, Pa.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

Generation, Transmission and Application of Electricity

Sangamo meters are rugged instruments of high accuracy. They are built for service as evidenced by the fact that they are used on the battleships, destroyers and submarines of the United States Navy as well as ships of other nations. The mercury flotation principle of this meter makes it proof against the terrific shock of heavy gun fire.

Let our Engineers co-operate with you in solving your meter problems.

NATIONAL PRODUCTS

FLEXTUBE

We cannot tell you *all* about *all* National Products in this limited space, but we do want to call your especial attention to certain features of **FLEXTUBE** Non-Metallic Flexible Conduit.

It's the **original** seamless interwoven non-collapsible non-metallic flexible conduit with the "rollerbearing" interior. There's absolutely no waste; every foot of every coil can be used, and it's so easy to fish that it's a pleasure for the wiremen to use. That makes it profitable for the contractor, and its quality is such that the best interests of the owners are served. Note the construction. The seamless interwoven tubing compounded; then the protecting outer braid, also compounded—a double compounded tubing which is satisfying to those who insist upon the highest quality. Place your order for your requirements with your jobber; specify by name—**FLEXTUBE**.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

How the Dealer Stands in the scheme of **LACO SELLING**

Every Dealer who handles Laco Lamps is considered by this Company as a worthy part of the machinery of distribution to users.

His efforts are appreciated and no methods or means are adopted by the Company to lessen or avoid his Dealer Profits.

These points have a direct bearing on the splendid business relations now existing between this Company and the many Dealers throughout Canada now selling Laco Lamps.

The Laco Dealer is protected and supported in many ways.

1. Laco Lamp sales and profits are based on a sliding quantity basis—a worth while profit remuneration for worth while sales efforts.
2. Laco Lamps assure full margin of profit as full retail price is protected.
3. Laco prices to Dealers are such that Dealers can handle, at a profit, business of the largest factories in their districts.
4. Laco Lamps have exclusive talking points:—A non-quibbling guarantee—1500 hours *individual* life against 1000 hours *average* life of the nearest other guaranteed lamp.
5. Extensive Laco advertising, before a customer enters the store, makes him prefer Laco Lamps.

These are advantages that work day and night for every Laco Dealer.

Write to-day for complete information.

EDMONTON

Announcing The New "Franklin" Fuse

*H*ERE, at last, is the non-destructive, renewable fuse.

*W*ITHOUT injury to its container, or to the fuse box and its surroundings, it is absolutely positive in opening high capacity short circuits.

*N*O flash, no flame, no violent action accompanies its blowing.

Of course, these important results in operation are obtained only by reason of radical departures from existing designs.

The fuse-box is of light skeleton construction with panels of asbestos lumber. If desired, the fuse may be withdrawn from the circuit by opening the door.

Explosions due to the rupturing of high capacity short circuits are so completely absorbed that it has been possible to seal the fuse in a tight container, so that flaming gas cannot escape.

J.C. REFILLABLE FUSE PLUGS

***"Used with
Arcarest
Refills"***

THE CLEMENS ELECTRICAL CORP.
OF CANADA, LTD.

KING WILLIAM & FERGUSON AVE

Hamilton

Canada

J. C. REFILLABLE FUSE PLUGS have been developed to fill a demand for a refillable Fuse of the Plug type which would be simple in construction, simple to refill, serviceable, and saving in costs.

Standard Fuse Plugs when burnt out are thrown away, or scrapped, which is wasteful and expensive, especially in these days of conservation.

J. C. REFILLABLE FUSE PLUGS save this waste and expense, as when they burn out they can be refilled, and refilled twenty to thirty times, at a cost of 1c each.

Our Arcarest Refills are simple in design, and require no tools to insert them in Plugs.

THE J. C. REFILLABLE FUSE PLUGS stand highest in protection, service, and saving, and are manufactured to conform with the National Electric Code Standard dimensions.

J. C. REFILLABLE FUSE PLUGS are guaranteed to give perfect satisfaction.

J. C. REFILLABLE FUSE PLUGS are used mainly in Industrial Plants, Office Buildings, Hotels, Railways, and other large users of Fuse Plugs. Also operating Companies are particularly interested in them, as it enables them to reduce the Capital tied up in carrying a large varied stock of Fuses. By using our Arcarest Refills it is very convenient to change to any capacity required.

J. C. REFILLABLE FUSE PLUGS are interchangeable to any capacity from 6 to 30 amperes.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

Reasons For R&M Fan Reliability

Reason Two— The Stator

The stator core of the R&M induction type fan is built up of steel laminations which are securely riveted together. Eight screws, four at each end, hold the core in place in the frame.

The stator coils are carefully wound in the slots after the slots are thoroughly insulated by a high grade insulating material.

Fibre wedges of high dielectric and mechanical strength hold the winding in the slots.

The winding is also insulated from the core at each end by a heavy fibre disc.

The winding is impregnated with a moisture proof insulation compound which is baked in, making the fan free from injury by moisture.

After completion every stator is subjected to insulation tests which insures that the winding will stand up under voltages far in excess of the normal operating voltage for which the fan is built.

Electro-Culture as a Solution of our Depleted Farm and Garden Land

Now that the war is over and we have time to settle down to work that demands experimentation and research covering extended periods, one of the first items to which it appears we should turn our attention in Canada is more intensive cultivation of the soil and, in this connection, the value of electricity, not only as a motive power, but also in reference to its influence in stimulating growth. Canada has done nothing in this direction, nor indeed have any definite results been obtained on this continent. Possibly the idea of intensive farming appeals to us less because of our tremendous fertile areas which hold out alluring prospects of landed proprietorship—not always justified by the dividend returns on capital expenditure.

It may be that the cultivation of large areas by individual farmers will continue to be the ideal in Western Canada for many years to come, but in Ontario and the East this system is becoming continually more difficult. The conditions East do not lend themselves as readily to the extensive use of tractors and other large labor-saving machines. More important still, perhaps, the land in these older settled portions has become, to a considerable degree, exhausted and the problem of building up the soil again must be solved or production will gradually fall lower and lower.

The use of electricity for both improving the quality and increasing the production has received considerable attention in England. They have tried treating the seed electrically before sowing, as well as treating the crop during growth. Last year about 2,000 acres of electrified seed was

tried out by English farmers and gains all the way from fifty per cent. down to nothing were reported, but it was finally decided that 90 per cent. of the seed showed gains over untreated seed. We understand that some twenty-five plants for the electrification of seed will be in operation during the present year.

Electric treatment of growing crops may almost be said to have reached a commercial stage. The most recent reports describe experiments carried out at Llantwit Vadre in South Wales on last year's potato crops, which showed a difference of 12.6 per cent. between the electrified and the control crops. In 1917 the gain had been somewhat larger—17.2 per cent. The equipment in use in these experiments was of sufficient capacity to care for 100 to 150 acres and its cost was approximately \$1,500. The amount of energy required is inconsiderable.

In view of the fairly satisfactory results obtained from this and other experiments it would almost seem as if we would be justified in trying out the electrification process of increasing our production in Eastern Canada. Just how far it would dispense with fertilization is not yet known but, as an auxiliary an experimental plant or two should give results to justify the expenditure.

Electric Generation and Distribution in Canada

A very complete report covering "Electric Generation and Distribution in Canada" has just been issued by the Commission of Conservation of Canada. The report is by Leo G. Denis, B. Sc., E. E., hydro-electric engineer to the Commission. The object of the report is to show the important place electric energy occupies in Canada and, at the same time, provide the various companies and individuals concerned therewith with information in other places. It will also serve, in large part, as a general power survey as, in most cases, the kind of power used to operate an electric plant in a certain district will be found the most advantageous.

The figures show that there is a total of 565 electric generating plants in Canada with a total capacity of 2,107,743 h.p., supplying 752 distributing systems of varying importance, covering some 975 municipalities. According to the kind of prime movers, this total is made up as follows: 270 hydro-electric plants aggregating 1,806,618 h.p.; 201 steam plants aggregating 288,202 h.p.; 49 gas plants, (mostly producer gas), aggregating 8,157 h.p.; and 45 oil and gasoline plants, aggregating 4,766 h.p.

The situation in various parts of Canada is well illustrated by the figures in this report. We find steam and water power in the Maritime Provinces, with a predominance of the former. In Quebec, Ontario and Eastern Manitoba, water power is the dominating source of energy for large centres and most of the smaller towns are supplied by electricity produced by water power. In the Middle West large plants are steam operated, while smaller ones use internal combustion engines. In British Columbia and Western Alberta, we again find water power predominating, but the generous coal supply in certain districts also permits considerable steam operation.

The ownership of the various plants included in the report is divided into 207 municipal or publicly owned plants of 452,508 h.p. capacity and 358 privately owned plants of 1,655,235 h.p. capacity.

Of the various plants, 274 give continuous service, night and day, while 220 give only a night service; these latter, however, are only small installations so that their total capacity is relatively unimportant.

An interesting diagram showing the distribution of power developments in Canada is reproduced from this report, on page 28.

First Technical Clearing House Opened

In our last issue we made reference to the great need of some government medium through which the returned technical men can be brought in touch with the various individuals, companies and municipalities who are in need of engineering assistance. Action has been very prompt and we are glad to be in a position to say that the government has considered the plan, put forward by a number of engineers, favorably and that details are being rapidly worked out. It is possible that by the time this reaches our readers some of the offices will have already been opened and placed in charge of technical officers. As far as possible the technical bureaus will be in close proximity to the employment bureaus already established by the government though the two departments will of necessity be separate on account of their entirely distinct fields of action.

In order to make these bureaus a success it will be necessary that they have the co-operation of all employers of technical men and more particularly the larger organizations that can absorb larger numbers. It is not possible yet to announce the exact location, but any information or inquiry addressed to the government employment bureaus and marked "technical" will doubtless, in the meantime, be properly re-directed. As soon as it is possible to gather the information it is planned to have on file, on the one hand, lists of all technical positions vacant, with particulars, and, on the other hand, lists and qualifications of technical men who are out of employment. Primarily this clearing house is intended for returned men, but, if it proves of sufficient value, may doubtless be extended in scope.

The head of the organization, we understand, will be in Ottawa and the present plan is to open technical bureaus in about ten or a dozen of the larger centres only—Toronto, Montreal, one or two cities in the East; Winnipeg, Vancouver, and two or three western intermediate cities.

[Just as we go to press the temporary location of the Toronto office is announced as 287 Queen St. West.—Ed.]

Experimental Demonstration of Power-Factor

At the afternoon meeting of the Association of Municipal Electrical Engineers, on Jan. 31st, Mr. H. W. Price, Associate Professor of Electrical Engineering of the University of Toronto, delivered a very comprehensive talk on Power Factor, accompanied by an experimental demonstration. The lecture was given in Room 25 of the Engineering Building.

For the purposes of demonstration an artificial transmission line was utilized, a line reactance being inserted in such a way that it could be shunted or placed in series with the line in order to demonstrate the effect of reactance on line regulation. At the receiving end of the line were placed resistance, reactance and capacity loads with ammeters in series with each of the loads, a line ammeter and a line wattmeter also being utilized. A reactive voltampere meter was also connected in circuit.

Preliminary to the experimental demonstration, Mr. Price developed non-mathematically, the general conditions of the alternating circuit and illustrated the nature and effects of leading and lagging currents by mechanical and other analogies. Then, by means of the apparatus the actual conditions in the circuit co-incident with the different classes of load, singly and in conjunction, were demonstrated and numerical results arrived at. The oscillograph was then connected in the circuit and the voltage and current wave forms shown on the screen for the different classes of loads singly and in combination.

As a result of Professor Price's talk the members present were given a very clear and concise understanding of

the question of power factor, particularly in its relation to power contracts and the cost of power.

The effect of low power factor on line regulation and methods of correction were also illustrated very clearly by means of the experimental apparatus.

Gres Falls Development Likely to Start in 1920

The Shawinigan Water & Power Co. continues to expand. The gross earnings for the year amounted to \$3,621,074, an increase of \$718,864, while net revenue, after charges and depreciation, amounted to \$1,410,093, an increase of \$59,229. Mr. J. E. Alfred, the president, explains that the operating costs were seriously affected, through the increased cost of labor and material, insulators, copper coils for generators, and many similar items having trebled or quadrupled in price. The various electric power companies owned and operated by the company had a satisfactory year, although increased cost of operation, due to extra labor and material costs, absorbed the slight increases which were made for power and light. These companies, generally speaking, had not been largely affected by the cessation of the war.

The year showed a very large increase in the total kilowatt hours generated for the Shawinigan system, the amount being 1,058,127,769 kilowatt hours. This figure represented an increase over the preceding year of 12 per cent. Owing to the heavy load conditions existing, the option, which the Shawinigan Co. had for additional power from the Laurentide Power Co., was exercised. The next step was the development of the power at Gres Falls, a property owned by the Shawinigan Water & Power Co. This development has a capacity of about 100,000 horse-power, and would take two years to construct. The directors felt that the present is not a suitable time to proceed with this development. Engineering information was being obtained, and plans being made, which would be available when the proper time arrived to commence construction work. The work would probably be started in 1920.

During the year ended 31st December last the gross earnings of the Laurentide Power Co. totalled \$870,393, an increase of \$206,535, while the net revenue was \$211,767, an increase of \$106,972. The directors have declared an initial quarterly dividend of one per cent.

Dr. Jewett Lectures in Hamilton

By the courtesy of the Royal Canadian Institute, Toronto, the very instructive and interesting lecture on Industrial and Scientific Research was repeated by Lt.-Col. F. B. Jewett, Ph. D., Chief Engineer, Western Electric Co., New York, and Vice-President, American Institute of Electrical Engineers, at a meeting of the Hamilton Branch of the Engineering Institute of Canada, in the Royal Connaught Hotel. The lecture room was filled to capacity, and the numerous questions which were asked Dr. Jewett at the close of the lecture showed the keen interest taken by the audience.

Dr. Jewett first gave a discussion of the large problems of starting up and developing research work for manufacturing concerns in general. Very few companies are large enough to establish complete research departments, as the Bell Telephone Co., of the United States, and some other companies, have done. However, the smaller companies should not be deprived of the benefits of having their problems worked out by modern scientific research methods, and some co-operative research organization should be developed. In this the universities, the government, and the manufacturing interests should take part, various methods by which they could do so being discussed by Dr. Jewett.

One of the greatest difficulties encountered in carrying

on research work on a large scale is the lack of thoroughly trained scientific investigators. Although Dr. Jewett expressed himself as being a firm believer in the great results to be obtained from properly conducted scientific research, he repeated a note of warning against attempting to build up research organizations without thoroughly educated and experienced research workers. He considered that such organizations should not be built up too rapidly, but should have a normal rate of growth, and he also gave warning against taking from the universities the men who are training future investigators.

Dr. Jewett then showed an interesting collection of slides illustrating the results of the work of his organization. The long distance telephone line from New York to San Francisco, the multiplex telephone, the wireless telephone as used on war ships, destroyers, aeroplanes, and other remarkable developments in telephone work were described.

A vote of thanks to Dr. Jewett was moved by H. U. Hart, Chief Engineer of the Canadian Westinghouse Co. The Chairman of the meeting was E. R. Gray, City Engineer.

Dr. Jewett addressed the Canadian Manufacturer's Association of Hamilton, earlier in the day, on the subject of research, and his visit is expected to be productive of valuable results in the campaign for increased research work in Canada.

City of Toronto Buys Out Toronto and York Lines Within City Limits

Provided the new agreement between the city of Toronto and the Toronto & York Radial Ry. Co. is approved by the city council and ratified by the Provincial Legislature, the city will purchase the company's property and rights within the city limits for \$590,000. For two years the city has been discussing with the company the acquisition of that portion of its Metropolitan Division within the city limits. Arbitration proceedings were being carried out under an Act of Parliament which empowered the city to buy out the company in return for the retention of running rights by the company at a value to be determined by arbitration. The agreement will close up the negotiations and render further proceedings by the Ontario Railway Board unnecessary.

The line of the Toronto & York Radial Ry. Co. which the city proposes to take over, runs between Farnham Ave. and stop 26 on Yonge St., a distance of 3.4 miles. The substance of the agreement is that the city purchase all rights, franchises and privileges owned or exercised by the company within the city limits, together with overhead and ground equipment, rails, etc., eight standard cars and all other property of the company within the city for \$590,000 cash.

As soon as the agreement becomes effective, the company is to cease the operation of its cars over that portion of Yonge St. within the present city limits and will establish a terminal station near the northerly city limit. If the physical conformation of the land on the west side of Yonge St. immediately outside the limits of the city renders it impracticable to establish a terminal station at that point, the company may erect such a station on a site within the city limits and may operate its cars between the city limits and such terminal station on tracks which are to be constructed and maintained, with the necessary structures and overhead, by the city. For the use of these the company is to pay an annual rental of 7 per cent, per annum upon the cost of such construction.

The company derives the right to establish receiving and forwarding stations within the limits of the city, all such receiving, forwarding and terminal stations not to be situated on streets or squares or public places, and transfer of any package freight or express goods is not to be made on street or public places. The company has made arrangements for the leasing of space in St. Lawrence Market as one of these receiving stations, at an annual rental of \$2,000.

Until the city acquires the street railway now operated by the Toronto Street Ry. Co. the city is to provide cars to carry package freight and express goods of the company to and fro between the new Yonge Street terminal and the terminal to be provided by the company near Farnham Ave. The city is to permit the Toronto Ry. Co. to carry this freight from the Farnham Ave. terminal station to the receiving and forwarding stations referred to above. When the city acquires the street railway, it is to furnish and operate cars to transfer the package freight and express goods to and fro between the new Yonge street terminal and the receiving and forwarding stations. The company's employees are to transfer the freight to and from the cars of the city at these terminal or receiving stations at the company's expense, but the cars are to be moved by the city when required by the company. The city is to be reimbursed for the granting of this privilege by the company's payment of depreciation and maintainance charges upon the cars provided by the city exclusively for the carriage of freight, and, in addition, interest of 6 per cent. per annum upon the cost of these cars. The company is also to pay the actual cost of platform labor and the actual cost to the city of electric power used in the transportation of such of these goods, except that no charge is to be made for power used from midnight to six o'clock. This provision is intended to induce the company to restrict traffic to these hours.

After the street railway is acquired by the city, it is, if the company desires, to construct and maintain on the public streets of the city, the tracks and necessary structures and overhead required to give access for cars to the receiving, forwarding and terminal stations and the company is to pay to the city the entire cost of the construction.

The new agreement also makes arrangement for similar transportation of package freight and express goods from the Mimico and Scarborough divisions of the company, should the city at any time operate any civic-owned car lines to points of contact with these divisions. A point of contact is considered to be established when any line of the company at the present city limits is within a distance of 1,320 ft. of a line operated by the city, measured along city streets, except in the case of the Scarborough division of the company where this distance is to be 3,300.

The city is to permit the company to carry on the city poles the electric power cables and telephone wires used by the company in the operation and dispatch of cars upon their system outside the city limits, at a specific annual rental. After the acquisition of the Toronto Railway Company's property by the city, the power cables are to be removed, but the city is to continue to carry the telephone wires.

The immediate effect of the acquisition of this portion of the Metropolitan Division will be the arrangement of plans for the double tracking of Yonge Street to the city limits and the installation of a complete sewer system for North Toronto, followed by the permanent paving of the roadway.

The new arrangement has been carried out on behalf of the city by Works Commissioner Harris, Finance Commissioner Bradshaw and City Solicitor Johnson.

A Correction

Through a compositor's error a line was dropped out of an item, which appeared in our February 15th issue, regarding a contract awarded to the Canadian Westinghouse Company for the supply of two generators for the Hydro-electric Power Commission of Ontario, to be installed at Queenston. Instead of the item reading "each of these turbines has a capacity of 45,000 kv.a." it should have read "each of these turbines has a capacity of 52,500 h.p. and each generator a capacity of 45,000 kv.a."

ELECTRIC PLANTS IN CANADA

The diagram herewith shows the aggregate capacity of the electric plants in the various areas, each of which includes 5 degrees of longitude. Thus, the most easterly indicates the capacity of all electric plants in Canada between longitude 60°W and 65°W; the second the capacity of plants between longitudes 65° and 70°, and so on.

The great importance of the St. Maurice, St. Lawrence and Niagara Rivers is particularly noticeable.

Industrial Illumination—Theory and Practice

A Brief Review of the Elementary Laws of Light, with Practical Suggestions for Better Lighting in Factory, Office and Warehouse

By Geo. K. McDougall, B.Sc.*

Adequate illumination for industrial enterprises, with the improved means for obtaining it, is being appreciated by many and every day more interest is being shown in this subject due to the distinct bearing it has on efficiency and welfare of employees.

With a view to promoting interest and discussion on the subject of illumination, this paper has been prepared. The subject matter contained herein is simply a collection of information, briefly covered, which may be found more fully taken up in textbooks and technical articles on illumination.

Before touching on the practical side, the fundamental laws of reflection and transmission of light will be briefly covered, to allow of the easier understanding of their application.

The common laws of reflection and transmission are well known and widely utilized by designers of lighting equipment, but unfortunately many mistakes are made in the application of such equipment by those who are not familiar with these laws.

Touching briefly first on the laws of reflection and transmission of light, we have:

1. The Law of Reflection. The angle of reflected light is equal to the angle of incident light.

2. The Law of Refraction. The sine of the angle of refraction of a light ray passing from one medium into another is equal to the sine of the angle of incidence multiplied by a factor which is determined by the relative refractive indices, or the relative optical densities of the two media.

The law of reflection is illustrated by Fig. 1 and the law of refraction by Fig. 2.

When we consider the result of a pencil of light rays, i.e., a collection of parallel light rays we may obtain results

FIG. 1
REFLECTION

which appear quite different from those we would expect when applying these laws, due to differences between the different parts of the reflecting or refracting medium scattering the rays. Each individual ray, however, is following the regular laws in spite of the fact that, collectively, they are not.

This now brings us to the general laws of reflection and refraction of a collection, or pencil of light rays.

First considering the secondary laws of reflection, three in number:

1. The law of regular or specular reflection.
2. The law of spread reflection.
3. The law of diffuse reflection.

Illustrating these laws—Fig. 3 shows the operation of the law of regular or specular reflection. In this case the angle of incidence of the light rays is equal to their angle of reflection. This kind of reflection is obtained from mir-

FIG. 2
REFRACTION.

rored glass, prismatic glass and polished metal surfaces.

Fig. 4 illustrates the law of spread reflection. Spread reflection is obtained from etched prismatic glass and from rough metallic surfaces. It is to be noted that in this kind of reflection that the medium intensity of the reflected light is in the same direction as in regular reflection, but a part of the light is scattered slightly out of this line, producing the effect of a spreading beam of light of the same general direction as in regular reflection.

Fig. 5 illustrates the law of diffuse reflection. In the case of diffuse reflection the maximum intensity of reflected light is always normal to the reflecting surface and the light is reflected through an angle of 180°. This holds over a large range in the angle of incidence. If a photometric curve is plotted of the light reflected from a small surface it will be found that the intensities are represented by a sphere, or considering one plane cutting the point of incidence, by a circle. This distribution of reflected light follows what is known as the cosine law, which is that the intensity of reflected light at any angle from the normal to the surface is proportional to the cosine of the angle.

Diffuse reflection as ordinarily obtained, is caused by

*Before the Montreal Branch E.I.C.

reflection from particles beneath the surface. This will be better understood by referring to the magnified view in Fig. 5. The light rays penetrate the material and are reflected back and forth between the minute particles and finally emerge in all directions.

It may appear that diffuse reflection is obtained by surface reflection, but if the substance under consideration, which gives diffuse reflection, is examined, it will be found otherwise. Taking, for instance, a piece of matt surface paper or blotting paper, which is diffuse reflecting material,

it would appear, at first thought, that the reflection of light is from the surface, but holding the paper up to a bright light it is found that it transmits light, which proves that the light is entering the material.

Examples of materials giving diffuse reflection are opal glass, porcelain enamel, paint enamel, also kalsomine and paint finishes commonly used for walls, ceilings and interior decoration.

The property of diffuse reflection of common interior finishes is a very valuable one from the point of view of interior lighting.

It is possible to obtain combinations of regular and diffuse, spread and diffuse, or regular and spread reflections from the same material. These combinations are illustrated in Fig. 6.

In Fig. 6A is represented the combination of regular and diffuse reflection. The regular component is surface reflection and the diffuse component is sub-surface reflection. This is one of the most important types of reflections

met with in practice and is obtained from such materials as porcelain enamel finish, opal glass and paint enamel when the surface has a gloss finish. The component of regularly reflected light, though appearing large, is really comparatively small and unimportant and actually is rarely more than five per cent. of the total light reflected.

Fig. 6B illustrates the combination of spread and diffuse reflection which is obtained from materials such as porcelain enamel, or opal glass when the finish is rough.

Fig. 6C shows the combination of regular and spread reflection which is obtained by reflection from two surfaces of a material such as the inside and outside of a piece of glass when the outer surface is roughened. Crystal glass

roughed outside gives this combination which, in practice, is unimportant as the materials giving it are not satisfactory as reflectors.

Considering the types of reflection from a practical standpoint it is seen that the most accurate control of light is obtained from materials giving regular or specular reflection such as mirrors or polished metal surfaces. This type of material is used in the manufacture of reflectors for searchlights, headlights, etc., where accurate control is required. It is to be noted, however, that this material is not satisfactory for reflectors to be used in general illumination, due to streaks or striations of light resulting from the reproduction of the image of the light source on the illuminated surface. Mirror reflectors having corrugations should not be confused with the above as they give spread reflection.

Surfaces giving spread reflection, such as corrugated mirrors and aluminum paint finish are of great importance, and while less accurate in the control of light than those materials giving regular reflection, are sufficiently accurate for most practical requirements in commercial reflectors. With spread reflecting surfaces it is possible to design reflectors whose shape will give all the light distributions required for interior illumination purposes. Striations or streaks on the surface illuminated are eliminated by the use of spread reflecting material in reflectors.

The accurate control of light with diffuse reflecting ma-

terials such as porcelain enamel finish and opal glass is difficult. The general direction only of the light can be controlled and reflectors made of this material are only useful where a general downward distribution of light is required. A focussing distribution of light or other extreme distributions are impossible when a diffuse reflecting medium is used. It so happens, however, that the distributions most commonly used in commercial and home lighting fall within the range of those that can be obtained from diffuse reflecting materials.

The prismatic glass reflector belong to the type of reflector giving spread reflection, and when accurately designed will give a wide range of distributions with considerable accuracy. Fig. 7 is a cross-section of a portion of such a reflector. The light ray passes through the inner surface, where a small portion of it is reflected, the balance is regularly reflected twice from the outer surface and then passes back through the inner surface. Due to the several reflections, the inequalities in the glass cause the rays to be slightly spread from the direct path of regular reflection. This slight spreading has the advantage of eliminating striations without reducing the control of light, which is one of the important advantages of the prismatic reflector. It should be remembered that in order to get the results for which it was designed, a prismatic reflector should be used with the size lamp and lamp position called for by the

manufacturer, otherwise a totally different distribution of light may result.

Summarizing the important uses of the different reflecting media it is observed that for the most accurate control of reflected light regular or specularly reflecting materials are used. Reflectors of this type are not satisfactory for general purposes of industrial illumination unless some provision is made to get rid of the striations produced.

Spread reflection allows of a fair control of light and materials having this characteristic are of great practical use for industrial reflectors. It is possible with spread reflecting surfaces to design shapes of reflectors giving the distributions most widely used in interior illumination.

Diffuse reflecting materials are difficult to control light with and are only useful where a general distribution of light is required.

Light Transmission

The primary law of reflection governs the path of a light ray passing through a material. This law was defined earlier in this paper. When a beam of light, however, passes through and emerges from a medium, the resultant emerging light follows laws very similar to the secondary laws of reflection. For brevity they will be enumerated and il-

lustrated and illustrated in diagrams only, on account of their similarity to the laws of reflection.

These laws are:—

1. The law of Direct Transmission.
2. The law of Spread Transmission.
3. The law of Diffuse Transmission.

Direct Transmission. Figure 8A, is obtained with clear glass. The light passes through without change in direction except for a slight displacement at each surface due to refraction. A small portion of the light is reflected at both surfaces and absorbed in passing through the medium.

Spread Transmission. Figure 8B, is obtained from materials having an irregular surface such as clear frosted glass and clear glass having a wavy or crinkled surface. The general direction of the emerging light is in same direction as the incident light. The deviation being caused by refraction at the irregular surface.

Diffuse Transmission. Figure 8C, is obtained from opal glass and is caused by the refraction and reflection of the light in passing through the medium. The emerging light follows the cosine law.

It is interesting to note the effect on appearance of globes having different light transmission properties.

With direct transmission the light source is visible. With spread transmission the light source is seen as a bright spot gradually fading in intensity towards the edges. With perfect diffuse transmission the light source is not distinguishable and the globe appears equally illuminated. It is possible to obtain numerous combinations of the different

types of transmission analogous to those obtained in reflection, but they will not be touched upon here.

Natural Illumination

Natural daylight being the most important source of illumination available, it is well to consider briefly its control.

There are numerous different types of window or street glass on the market, and it is of interest to note their effect

on the resultant illumination of a room. First in common use is clear glass, which has direct transmission, i.e., the direction of the light rays after passing through are in the same direction as originally. Between 10 and 20 per cent. of the incident light is reflected or absorbed. Objects can be clearly seen through it without material distortion.

Next come the clear sheet glasses having various degrees of spread transmission of light caused by irregular refraction due to their irregular surfaces. The greater the irregularities of surface, the greater the spread of the rays of light. In the use of this type of glass it is to be borne in mind that care must be used in the placing, especially, where it is exposed to the direct rays of the sun. Most people have experienced the discomfort of facing a window near the eye level, glazed with glass, on which the sun was shining, having a fairly large amount of spread transmission. The glass appears extremely bright, due to some of

the sun's rays being deflected into the eyes. This property of deflecting some of the rays is extremely useful in increasing the illumination in the part of a room away from the window, but care should be taken to avoid producing a glaring condition.

The ability to see through glass having a spread transmission characteristic depends upon the amount of irregularity in the surface.

Glass having diffuse transmission, such as opal glass,

is not often used to any great extent for window glass.

Prism glass is frequently used for bending light rays into a new direction where they will be more useful. In the use of prism glass, the angles of the prism must be accurately designed for the particular location, to obtain the results intended.

Artificial Illumination

From the standpoint of artificial illumination, it is important that the general laws of reflection and transmission be understood as applied to practical problems to enable their proper solution. These laws have been already covered in a general way.

The problems of artificial illumination for industrial purposes may be roughly divided into two general classes:—

FIG. 7.

the lighting of offices and the lighting of workshops. Each one of these has its own particular problems.

In general, good illumination should conform to the following requirements:—

(a) There should be an adequate amount of light coming from the proper direction for the easy performance of the work involved.

(b) Heavy contrasts should be avoided.

(c) Glare should be reduced to a minimum.

The Illuminating Engineering Society specify in their code, which has been adopted by law in numerous States of the U. S., gives the desirable intensity of artificial illumination for different classes of work as follows:

Storage, passageways, stairways and the like 0.25 to 0.5

Rough manufacturing and otherlike operations 1.25 to 2.5

Fine manufacturing and other operations of

a like character. 3.5 to 6.0

Special cases of fine work. 10.0 to 15.0

The foot candle is the illumination produced by a source of 1 candle power at one foot distances. At 2 feet distance the illumination will be one-quarter foot candle as the inverse square law applies.

The smaller values in the table are minimum intensities, but it will be found, as a rule, that the higher values will be productive of the best results.

For daylight conditions, the code states that the figures in the above table should be increased three times for satisfactory conditions on account of the greater intensity of light required in the daytime, due to the physical condition of the eye.

The eye is so constructed that it adapts itself for different intensities of illumination. Out of self protection it adapts itself to the maximum intensity in the field, and it is quite possible, where there is a bright spot in the field, for the eye to be adjusted for this intensity and yet be attempting to see in a less illuminated area, with consequent

reduction in powers of vision. This is a common fault in a great many of our old systems of illumination where unshaded lamps are employed. An exaggerated conception of this condition of lighting is illustrated by the automobile headlight in the field of vision of the opposing driver.

Bright reflections from polished surfaces are also conducive of this condition. Heavy contrasts are produced when local areas are highly illuminated with reference to their surroundings. This condition obtains in the use of shaded lamps close to the work without other general illumination in the room. The glancing from the work to the surroundings causes a large readjustment of the eye, which if continued in will cause eye fatigue and discomfort.

The use of tungsten lamps, particularly the gas-filled type, are productive of heavy contrasts. On account of the considerably higher efficiency of these new types of lamps, they have been universally replacing the older types without, in most cases, the necessary change in the equipment.

Modern incandescent lamp filaments must be kept out of the normal field of vision if glare is to be kept down. This can be managed if they are used in proper reflectors and mounted sufficiently high. The consciousness of a bright light source disappears if it is mounted sufficiently high to subtend at the eye an angle of not less than 25 to 30 degrees with the normal.

Uniformity of illumination has a great bearing upon the ease with which work can be done. This question of uniformity is one which is of great consequence in the design of a lighting system. The direction of the light rays is also very important. There are certain classes of work in which shadows play a great part in assisting to see properly and bring out the proper form and perspective, while in others the elimination of shadows is an advantage. By shadow is not meant dense shade, but simply a grading of the illumination on different parts which is necessary to bring out form or shape without reducing the ability to see distinctly the parts less highly illuminated. In other words, work that requires the distinguishing of length, width

REGULAR TRANSMISSION

FIG. 8A.

and thickness, requires a certain amount of shadow, whereas that done on a plane surface, such as in office work, shadow is not a necessary adjunct.

Absolute uniformity of illumination is productive of monotony and, as a rule, should not be the aim of a designer.

The lighting out of doors on an overcast day creates a feeling of depression and lack of interest in one's surroundings, which can be attributed to a great extent to uniformity in the illumination. On the other hand, our interest in things is stimulated on a bright, sunshiny day, due to the added beauty and form of our surroundings caused by the high lights and shadows. It is worth noting, however, that even on a bright day out of doors contrasts between high light and shadow are never very great and seldom exceed ratios of twenty to one.

Glare is the term commonly used to describe the con-

dition obtained when there is a brightness within the field of view of such excessive character as to cause discomfort, annoyance or interference with vision.

The reduction of glare, in lighting, to a minimum, should be kept in mind in the design of lighting systems. Glare is really a condition of intense contrast and may be caused by improperly shaded lamps in the visual field, viewed against a dark background, or reflections of light sources from polished surfaces.

General Types of Lighting.

There are three general types of lighting in use at the present time, namely: Direct lighting, semi-indirect and totally indirect.

In the first, the direct rays from the lamp reach the work. In semi-indirect, part of the light is diffused through

SPREAD TRANSMISSION

FIG. 8B.

a bowl or other shading and diffusing medium and part directed onto the ceiling and re-directed to the work. In totally indirect the light is all directed to the ceiling and re-directed onto the work. Each of these types of lighting has its particular field of usefulness. The first directs the greatest proportion of the light produced onto the work and is also the most productive of glare. Shadows are sharper and more apparent with direct lighting than with semi-indirect or totally indirect.

In semi-indirect lighting there are two components of light, one from the source diffused through the bowl and the other from the ceiling. The ratio of these two components has a great bearing on the resultant illumination, the shadows produced and the appearance of the fixture.

As a rule, the bowl of a semi-indirect fixture should not transmit too much light, otherwise it will appear very bright and where installed in large rooms with relatively low ceilings, will be a cause of glare, also reflections of it on polished surfaces and glossy papers will be troublesome. Where large light sources are used in a semi-indirect fixture, the size of the bowl should be in proportion to the size and intensity of the light source.

One of the most common faults of this type of lighting fixture is the over-brightness of the inverted bowl.

Totally indirect lighting fixtures consist of an opaque reflector distributing the light onto the ceiling from which it is redirected into the room. This type of lighting produces the most uniform illumination and freedom from shadows.

As stated before, interior finishes and kalsomine paints are diffusely reflecting media and the maximum intensity of the reflected light is normal to the surface. The advantage of this is at once seen when light falls on the ceiling. In the case of walls, however, it is somewhat of a disadvantage as a considerable proportion of the light is reflected in directions which are not useful.

In order of efficiency of utilization of the light produced, direct lighting comes first, then semi-indirect and last, totally indirect. In considering efficiency of a lighting system, however, the fact should not be overlooked that it is the overall efficiency of the carrying out of an operation that

must be considered and that the lighting is simply one item of cost of production which is always a small proportion of the total cost.

Much interesting research work has been done in the last year or two on the effect of illumination on output. At the present time extensive experiments are being carried out by the Illuminating Engineering Department of the Commonwealth Edison Co., of Chicago, along these lines (Transactions Illuminating Engineering Society paper by Wm. A. Durgin, "Productive Intensities," November, 1918).

The data they have obtained is most valuable as they have conclusively shown that the production of departments of large manufacturing plants has been increased by at least 15 per cent. and in some cases by as much as 100 per cent., by improved illumination. When the cost of bringing about the increase in production is considered it appears as negligible compared with the result.

Analyzing the reasons for increased production under better illumination it is found that more work is turned out by operatives due to reduction of spoilage, improved accuracy, better supervision, reduced eye-strain and brighter and more cheerful surroundings.

Illumination has also a very great influence on accidents and there is cause for assuming that probably 20 per cent. of industrial accidents are attributable to lighting. The remedy for this is easy to apply and with the cry of "safety first" being continually heard, there is no reason why lighting should not be included amongst the mechanical safeguards against accident. The proper lighting of a danger point is an effectual way of pointing it out.

In spite of the large amount of advice and data that is appearing every day in technical journals, it is surprising to find that literally thousands of plants are paying very little attention to this advice, when it may mean thousands of dollars in their output with comparatively small expenditure involved for the necessary improvement.

The importance of illumination and its effect on general welfare may be further realized when it is known that many

DIFFUSE TRANSMISSION

FIG. 8C.

of the United States have adopted codes of illumination for industrial establishments, giving extensive powers to inspection boards over systems of illumination, and allows them to compel the installation of adequate systems. In our own country, with its short winter days, a large proportion of work is carried out under artificial illumination and, consequently, the possibility for increasing our efficiency is great.

Mr. R. F. Crosbie, assistant superintendent at the Regina electric power plant, died recently following an attack of Spanish influenza.

Electrical Equipment of the Dominion Iron & Steel Co., Ltd., at Sydney, N. S.

From small beginnings over twenty years ago, the Dominion Iron & Steel Co. has developed a large steel mill, making various products in Sydney, Nova Scotia.

The plant is situated on salt water, and iron ore comes from Newfoundland by steamers direct, unloading on the piers shown in the extreme left of the cut.

The process of manufacture of various finished products continues towards the right (Fig. 1), the finished articles consisting of steel rails, wire rods, merchant bars, wire nails, together with pig iron, steel ingots, blooms and billets.

As an indication of the size of the plant, let it be said that during the past year there was turned out the following gross tons: Pig iron, 289,900; steel ingots, 332,000; blooms and billets for sale, 69,000; rails, 114,350; wire rods for sale, 47,500; merchant bars, 850; wire nails, 7,200.

The vast majority of the plant is electrically driven. The main rolls of the rail mill are as yet steam driven, but these will shortly be converted to electric drive. Electric locomotives are used in handling coke at the coke ovens, and practically all of the overhead cranes in the plant are electrically driven.

For variable speed work, such as cranes, hoists, etc., 220 volts, direct current is used, and generally totally enclosed mill type motors with steel frames.

For constant speed work, 550 volt, 3 phase, 60 cycle induction motors are used, generally of the squirrel cage type, but in larger sizes, slip ring motors have been used for driving turbine pumps, etc., where it is necessary to decrease the starting current.

The generating voltage has been up to the present, a.c., 2,300 volts, 3 phase, 60 cycles, although a change is about to be made, and with the latest units installed, the turbines will be wound for 6,600 volts, 3 phase. The new power house being situated at the extreme end of the plant, and some of those installations which consume the largest amount of power being situated nearer the other end, the higher voltage is advisable. To transmit power to the fresh water pumping station, situated some five miles away, high voltage is also needed.

The transmissions to the various parts of the plant are altogether overhead, on wooden or steel pole construction.

The original power house installation made about twenty years ago, consisted of two 250 volt, direct current generators. About five years later there was added two 600 kw., 150 revolutions, 2,300 volt, 3 phase, 60 cycle generators, direct connected to reciprocating steam engines. This plant was situated at what was called No. 1 power house, to the left of the cut shown below near the blast furnaces.

When further power was required about the year 1910,

there was installed, near the rail mill (Fig. 1), two Ratteau exhaust turbines, each 2,000 k.w., 2,300 volts. These turbines were supposed to use exhaust steam coming from the various auxiliaries in the mill and were installed in a new power house called No. 2, near the rail mill, and to give uniform flow of exhaust steam, Ratteau accumulators were installed near them. These turbines also have means of introducing live steam when necessary, to carry over where there is not sufficient exhaust steam coming from the main roll engines, and other exhaust steam producers of the plant.

To operate the electrical auxiliaries of this plant, such as the condensing and circulating pumps, there was installed in 1917, a 500 kw., 2,300 volt Curtis turbo-generator, and any troubles on the large exhaust turbines then would effect the

Fig. 2—New Coke Ovens, Sydney, C.B.

continuous supply of water, etc., for the power house auxiliaries.

Equipment of No. 3 Power House

With the establishment of the new plate mill and other extensions, further power house equipment became a necessity. No. 3 power house is being built near the blast furnaces, and will take steam at 160 lbs. gauge, with 125 degrees F. superheat, this steam being generated by the blast furnace gas. In this No. 3 power house, there will be, at the outset, one 5,000 kw., 6, 600 volt, 3 phase, 60 cycle Curtis turbine; one 5,000 kw., 6, 600 volt, 3 phase, 60 cycle Curtis turbine; one 3,000 kw., 2,300 volt similar turbine; and one 500 kw. 2,300 volt turbine. A 28 inch vacuum will be obtained gen-

Fig. 1—General View, Dominion Iron & Steel Company's Plant, Sydney, Cape

cally through surface condenser's taking salt water from the harbor.

The final capacity of this No. 3 power house will be something over 20,000 kw. There will be two complete sets of bus bars, one for 2,300, the other for 6,600 volts; these bus bars being tied together by three 1,000 k.w. transformers.

On the lower voltage, solenoid operated switches will be used. On the 6,600 volts, type H3 motor operated switches

will be a considerably increased expense for gearing, etc., and considerably more room to be taken with the foundations, etc., with the geared arrangement. The voltage of this motor will likely be 6,600 volts.

Practically all of the auxiliaries in the rail mill are motor driven through M.D. (mill type) motors, generally with drum control, although contactor control is used to a limited extent.

New Plate Mill

A new plate mill is being constructed to roll 110 inch ship's plates. This building will cover about 650,000 square feet, and the main rolls will be driven by 4,000 h.p., 6,600 volt motor, 82 r.p.m. The total weight of this motor and its fly-wheel will be about 330 tons (660,000 lbs.). Motor will be of the slip ring type, with a small percentage of resistance permanently introduced into the secondary circuit, so that flywheel may deliver power to the rolls when the load comes on. The control equipment will be of the automatic contactor type with hand control for acceleration, also plugging points to bring the motor to rest in reasonable time, in spite of the great inertia of the moving mass.

All of the auxiliaries of this plate mill will be electrically driven. The electrical equipment will be of the most modern

Fig. 3—Interior Coke Oven Sub-station, Sydney, C.B.

will be used. Bus bars, etc. will be mounted in cells for the higher voltage, while pipe frame construction will be used on the lower voltage. As the amount of power which can be concentrated on the 2,300 volt buses is limited as indicated above, the reason for this design is apparent. Storage battery will be used for switch control.

The switchboard panels and lightning arrester equipment will be on the same level as the turbines. The oil switches, both solenoid operated and motor operated on the floor above. Transformers will be on the same level as the turbines.

The exciter equipment for this power house will consist, at the outset, of two 100 kw., steam driven turbo-generators. There will also be provided a spare motor driven exciter, but the regular exciting current will be supplied by the steam turbines, and short circuits or other electrical troubles on the feeders will not cause trouble on the exciters.

There is a decided advantage in separate steam driven exciters over exciters direct connected to the main turbines, or motor driven exciters.

The main rolls, those in the rail mill, have heretofore been driven by reciprocating steam engine, the exhaust from which was passed on to the exhaust turbines mentioned before. These rolls will be electrified, and driven by a motor of approximately 3,000 h.p., and if direct connected, the speed will be 82 r.p.m. If a gear is introduced between the rolls and the motor, the speed of the motor will be correspondingly increased, which will improve the power-factor, but there

Fig. 4—New Blast Furnace, Sydney, C.B.

design. Contactor control being very largely used, both on the cranes and on the auxiliary motors.

About 200 motors of various kinds and sizes will be required for the plate mill.

The nail mill is already electrically driven in most cases by constant speed induction motors, a large number of chain drives being used to prevent the vibration coming from the machines in the mill re-acting on the motors.

The coke oven plant is driven largely by M. D. (mill type) motors, while electric locomotives, 20 ton capacity, are used to haul cars of coke, etc., near the coking plant.

The question of the use of gas engines as prime movers was thoroughly discussed and it was decided that on account

of manufacture from left to right. Vast majority of plant is electrically driven.

of the heat balance on this plant, that steam turbo-generators were more advisable, and it is hoped to adopt a 5,000 kw. unit as the standard size, this being chosen largely on account of the economies available through its use. The first turbine of this size is now on order, and will be in operation very likely the fall of 1919. The choice of steam turbines or gas engines involves a number of points in Canada that are not involved in the United States. Reference here must be made to the highly refractory character of the iron ore, the high amount of sulphur in most of the Sydney coals, and the fact that gas engines are not manufactured in Canada as they are in the United States. While there has been some debate in the United States as to the best prime mover for steel plants, investigation has shown that as far as the Sydney plant is concerned, the choice of steam turbines is a wise one.

Interesting Motor Applications

There will be a number of interesting applications of electricity at this plant, particularly in the new plate mill in the handling of the plates and the rolls. In the older parts of the plant the use of M. D. mill motors has proven most satisfactory, the loss of production being very much decreased by the use of such high grade equipment. This is especially true when the atmospheric conditions at Sydney are taken into account, there being a combination of salt sea atmosphere with sulphurous gases from the coking and other processes.

Direct current is obtained now largely from motor-generator sets, and there will shortly be installed for this purpose, two 1,000 kw. sets, using synchronous motor drive. This will give power factor correction, which is required on account of slow speed of number of the large motors. Smaller motor generator sets, such as 500 kw. and 750 kw. size are used throughout the plant in sub-stations, which are more or less standardized.

Core type transformers are preferred in this plant, and generally these are self-oiled cooled. Fresh water is not usually obtainable in many parts of the plant for water cooling.

Fresh water supply is obtained from Grand Lake, situated some four miles from the steel plant, with motor driven pumps, many of the larger pumping installations, of course, handling salt water from the harbor.

A further extension of rolls driven by electric motors is contemplated, and the Sydney plant will certainly be in the forefront as far as the application of electricity to steel manufacture is concerned.

The low pressure steam turbines in No. 2 power house are of Ratteau design, the switchboard in that power house being of British Westinghouse manufacture. Most of the equipment in that power house was made in England.

No. 3 power house, which will contain approximately 20,000 kilowatts, will practically all be supplied by the Canadian General Electric Co., whose motors, both mill type and induction type, are standardized throughout the plant.

The large transformers throughout are generally Westinghouse or Canadian General Electric Company's manufacture. As the low pressure steam turbine installation was manufactured mostly in England, a number of English machines are in that plant.

Montreal Electric Club

"Thought as Applied to Business" was the subject of a talk by the Hon. F. Carrel, of Quebec, at the Montreal electrical luncheon on Feb. 19. He expressed the opinion that few business men gave sufficient thought to the big questions of the day, either political or municipal, and yet they complained if things went wrong or if taxes were raised. A change, he added, had come upon millions of people as the result of the war, and a more communistic spirit had been

developed. The claims of labour would have to be carefully considered; the evasion of this question would certainly lead to discord, which would be injurious to the country. In connection with the better spirit which had been awakened in some directions, Mr. Carrel mentioned that one large Canadian company proposed to erect standardised workmen's dwellings, the payment of which would be met from a bonus of 10 per cent. given to the workmen, who would thus soon become owners of their houses.

The speaker insisted that Canadians should develop their natural resources, and thus establish industries which would not depend upon foreign supplies of material. In this way we could build up an export trade on specialised lines. The Government should assist propaganda work to make Canada better known in the States and South America. He advocated the Government guaranteeing the bonds of companies started on sound lines for developing Canadian resources, and instanced a large water power in Quebec which could be developed under such conditions.

Toronto Branch A. I. E. E.

The Toronto branch of the American Institute of Electrical Engineers held a very successful meeting in the Engineers' Club rooms on Friday evening, February 21, when Mr. Frank R. Ewart, B.A.Sc., Consulting Industrial Engineer of Toronto, read a most interesting paper on "The Business Relations of the Engineer." An interesting discussion followed, in which it was evident throughout that a very great deal of good could result from an interchange of ideas among men who were honestly desirous of fair dealing. The discussion covered the relation of the engineer in private practice to the large corporations having their own engineering departments; the relation of the engineer to the contractor, to the architect and to the owner. Some fine ethical points were brought out and insisted upon by Mr. Ewart.

The next meeting of the Club will be held on March 7 to discuss in a broad way the status of the branches of the American Institute of Electrical Engineers in Canada and the advisability of forming a purely Canadian electrical engineering association, still maintaining, perhaps, affiliation with the United States society. Electrical engineers are urged to attend this meeting and come prepared to discuss the question so that it may be viewed from every angle.

Engineers' Club Officers

At the annual meeting of the Engineers' Club of Toronto, a number of electrical men were elected to the directorate. The complete list of officers follows:

President, J. R. W. Ambrose; 1st vice-president, Melville P. White; 2nd vice-president, Tracey D. LeMay; 3rd vice-president, J. B. Carswell; directors, William A. Bucke, A. B. Cooper, E. G. Hewson, Charles H. Heys, Arthur H. Hull, J. H. McKnight, Walter R. McRae, L. V. Rorke, James R. Wainwright, Major Ward Wright, T. S. Young; secretary-treasurer, R. B. Wolsey. Mr. L. V. Rorke is chairman of the Admission Committee; Mr. W. A. Bucke, chairman Finance Committee; Mr. T. S. Young, chairman House Committee; Mr. J. B. Carswell, chairman Library Committee. At the suggestion of the President-elect, a committee was appointed to advise returned members regarding available positions in the engineering field, and another committee on the welfare of the engineering profession.

The Weekly Bulletin of the Department of Trade and Commerce, in a recent issue, gives the following figures for electrical apparatus imported into Canada: 1916, \$5,393,574; 1917, \$9,818,793; 1918, \$11,406,955.

Lieut.-Col. C. H. Mitchell, Well Known Consulting Engineer, Appointed Dean of Faculty of Applied Science and Engineering, University of Toronto

The announcement of the appointment of Lieut.-Col. Charles Hamilton Mitchell, C.E., D.S.O., C.M.G., C.B., as Dean of the Faculty of Applied Science and Engineering of the University of Toronto, will be received with universal approval in view of his outstanding war record, as well as the place he has established for himself in the engineering circles of Canada. As a widely-known consulting engineer, prior to the war, and, for the last four years, as a general staff officer, where his administrative ability has always won the highest praise, Lieut.-Col. Mitchell has attained an unsurpassed prominence, and his appointment to the Deanship of the largest engineering-training centre of the Dominion will meet with the hearty support of all who have the future advancement of the engineering profession at heart. Col. Mitchell was born in Petrolia, Ont., in 1872, and graduated from the University of Toronto in 1892 with the degrees of B.A.Sc. and C.E. His appointment as assistant city engineer of Niagara Falls, N.Y., followed; from 1894 to 1900 he was city engineer of Niagara Falls, Ont., engaging also in private practice in hydraulic engineering and

Lt.-Col. C. H. Mitchell

water power development throughout Ontario. From 1901 to 1905 he was engaged as principal assistant engineer of the Ontario Power Co., Niagara Falls, and during 1906 travelled in Europe studying hydro-electric power developments. Since 1906 he has been in consulting engineering practice in Toronto, in partnership with his brother, Percival H. Mitchell, E.E. Lieut.-Col. Mitchell's practice has been largely along the lines of hydro-electric power development, notably in the design and construction of plants throughout Ontario and the Canadian West. During 1909-10 he was engaged as consulting engineer to the Ontario Power Co. on the extensions, which doubled the capacity of the plant to 100,000 h.p. During 1911-12-13, he was consulting engineer to the Water Power Branch of the Department of the In-

terior, Ottawa, on water power and conservation in Western Canada. He has been consultant in many industrial undertakings and his opinion on various technical, legal and arbitration cases, has been greatly sought. As a writer he has been the author of "Aerial Mechanical Flying," 1896; "European Hydro-electric Power Development," 1907; "Aerial Navigation in Warfare," 1911; "Canadian Hydraulic Power Development"; "Electric Power in Canadian Industry"; as well as numerous shorter articles of technical, military, and mountaineering interest. He is a member of the Institution of Civil Engineers, London, England, a member of the Engineering Institute of Canada and the American Society of Civil Engineers. From 1901 to 1911 he was a member of the Civic Improvement Commission of Toronto, and from 1910 to 1912, vice-president of Toronto Civil Guild and president in 1914. Since 1913 he has been a member of the Board of Governors of the University of Toronto, for twelve years prior to that being a senator.

At the commencement of war Lt.-Col. Mitchell was a Major in the Corps of Guides and Divisional Intelligence Officer on the General Staff, Second Division, at Toronto. He was promoted to Lieut.-Col., General Staff Officer (Intelligence) with the First Canadian Division overseas. Subsequently he became General Staff Officer (Intelligence) to the Canadian Corps in France; General Staff Officer (Intelligence) Headquarters 2nd Army, B.E.F., in France; General Staff Officer (Intelligence) General Headquarters B. E. F. in Italy. Col. Mitchell's war awards include the following: Mentioned in despatches on six occasions; received the Distinguished Service Order, June, 1916; Companion of the Order of St. Michael and St. George, June, 1917; Officer of the French Legion of Honor, March, 1916; Officer of the Order of Leopold, Belgium, July, 1917; Croix de Guerre, Belgium, 1917; Companion of the Bath, 1918; Officer of the Crown of Italy, 1918, and the Italian Cross of War.

Lieut.-Col. Mitchell will continue his connection with the firm of C. H. & P. H. Mitchell, consulting and supervising engineers.

Electric Smelting of B.C. Ores

Dr. Arthur Stansfield, Professor of Metallurgy, McGill University, Montreal, has submitted a report to the Minister of Mines of the province of British Columbia, Hon. William Sloan, on a recent investigation into the feasibility of electric smelting of certain ores in that province. The report has not yet been made public, but it is understood that Dr. Stansfield reports favorably on the scheme and recommends that one or more of the best iron ore deposits be developed in order to make complete tests of the ore. At the same time he suggests the establishment of a plant for the production of charcoal from mill waste, the charcoal being required in the reduction of the ore. He also suggests an investigation into the latest electrical process for the reduction of ore and if this is found as satisfactory as he anticipates, that a reduction plant should be established at a point conveniently located to the ore deposits, the charcoal plant and, for the supply of power, a waterfall that can be developed at a reasonable cost.

Hydro Radial Vote in Hamilton District

On March 15 the electors of Hamilton will vote on a by-law authorizing an agreement between the Hydro-electric Power Commission of Ontario and certain municipalities for the construction, equipment and operation of an electric railway from Port Credit to St. Catharines. Under this agreement a total amount of \$11,360,363 debentures would be issued for deposit with the Commission, of which Hamilton becomes responsible for \$5,869,386, the balance being divided among the city of St. Catharines and the villages, towns and townships along the way.

Electro-culture Experiments at Llantwit Vadre

An interesting series of experiments on the stimulation of plant growth has been carried on, near Pontypridd, during the last two years on the field of the Star-Delta Potato Club, which is connected with the South Wales Electrical Power Distribution Co., of which Mr. W. A. Chamen is the engineer and general manager. From a copy of the report on the results obtained The Electrical Review publishes the following particulars:

The field had an area of 2.07 acres (see Fig. 1), and the soil consisted of a typical heavy loam, approximately 70 per cent. clay and 30 per cent. sand. In 1916 the field had grown oats, but in 1917, when taken over about March, it had been two-thirds ploughed. This was completed, but no manure was used in 1917.

In March, 1918, 41 tons (20 tons per acre) of colliery manure was spread evenly over the field. In April the field was ploughed once lengthways, then harrowed and rolled. After this, 10 cwt. of 30 per cent. super-phosphate and $2\frac{1}{2}$ cwt. of sulphate of ammonia was spread over the surface. It was proposed then to cross-plough, but owing to difficulty in obtaining a plough, and also to the planting season being due, the growers were compelled to open planting drills, and found only a fair tilth.

In 1917 potatoes were planted during the first week in May, and were lifted in the first week in October with the following results:

	Cwt. planted.	Cwt. lifted.	Ratio.
King Edward	2	4.46	2.25 to 1
Irish Up-to-Date .. .	20	81.7	4.0 to 1
King's President .. .	19	171.0	9.0 to 1
Arran Chief .. .	7.5	35.71	4.75 to 1
	48.5 cwt.	292.87 cwt.	6.0 to 1

In 1918 potatoes were planted in the first week in May, and lifted in the second and third weeks in October with the following results:—

	Cwt. planted.	Cwt. lifted.	Ratio.
Templar from			
Loch Leven.	48.6	370.4	7.6 to 1

For the purpose of the experiments, 400-volt., 25-cycle, single-phase current was stepped up by an oil-cooled, 10-kv.a. transformer to 32,000 volts, and rectified with a Delon type of rectifier, which held the voltage to 39,000 in dry weather and to 30,000 in the wettest weather. The apparatus gave no trouble at all, and held this voltage in the heaviest rain.

The area under electroculture was divided as follows:

	1917	1918
Electrified area .. .	1.21 acres	1.096 acres
Control area .. .	0.86 acres	0.977 acres
Total .. .	2.07 acres	2.07 acres

In 1917 the network consisted of 5,850 yards of No. 24 S.W.G. galvanized steel wire. The wires were spaced 6 ft. apart, with cross wires arranged in the same way, so as to make a mesh 6 ft. square. These wires were supported from main copper carriers of No. 6 S.W.G. The network at first was supported on E.H.T. insulators about 6 ft. 6 in. from the ground; later, on August 14th, this distance was reduced to 5 ft.

In 1918, 1,860 yards of the same size of wire was used, but the wires were spaced 9 ft. apart, with no cross wires

The network was movable, and was kept as nearly as possible 2 ft. above the haulms.

The 1918 arrangement was at right angles to that of 1917.

The voltage was measured in 1917 by a Kelvin and White electrostatic voltmeter, reading to a maximum of 100,000 volts. In 1918 it was measured by a sphere gap, previously calibrated. For measuring the current a Ferranti, d.c., 0-100-volt, moving-coil voltmeter (with the resistance cut out), calibrated as a milliammeter, was employed. This instrument, of course, gave the polarity as well as the value of the current. The synchronous motor being four-pole, by shifting the adjustable stationary arm of the rectifier a quarter revolution, the polarity could be reversed if necessary, but the network was kept positive. The ammeter was fixed on the negative.

In 1917, as stated already, the voltage varied from 39,000 volts in dry weather to 30,000 in wet weather. In 1918 it was 36,000 volts; and this did not vary 5 per cent. either way, the lower voltage being obtained during heavy rain and the higher during drier weather.

The current in 1917 varied from 2.5 milliamperes in dry weather to 4.0-7.0 in wet weather. In 1918 it varied from 0.35 in very dry weather to 0.8 during heavy rain, with an average of 0.5 during the normal weather prevalent in the district.

It was endeavored to keep the voltage constant during the treatment, and it is interesting to note the lower readings during 1918, which may be accounted for by the smaller

Fig. 1

amount of wire used as compared with the previous season, the ratio being 3:1. Further, the insulators used during 1918 provided a smaller leakage path.

Treatment was usually given between the hours of 6 and 9 in the morning and 7 and 10 in the evening:—

	1917.	1918.
Commenced Aug. 10 ..	Morning, 118 hours.	June 22, 294 hrs.
Finished Oct. 1 ..	Evening, 164 hours.	Sept. 27, 294 hrs.

Total .. .	282 hours	588 hrs.
------------	-----------	----------

The results of electroculture were as follows:

	1917.		1918.	
	Tons.	Tons per acre.	Tons	Tons per acre.
Electrified.	9.1	7.5	10.3	9.46
Control	5.5	6.4	8.2	8.40

Increase .. 17.2% Increase .. 12.6%

As previously stated, the apparatus never failed and was successful throughout, although difficulty was expected in keeping the network charged during heavy rain. On dark

nights it was easy to see the glowing network wires. In the rectifier hut grass grew extremely quickly through the rough flooring of old sleepers, especially under the voltmeter, and in the dark the tips of the blades could be seen glowing, but, after some days, these went a dark brown, evidently showing that the discharge was too intense. Insects, such as butterflies, etc., on many occasions were observed, and it was noticed that when flying under the network they kept very close to the ground, or else flew back away from the wires. Insects that happened to alight on the wires in the hut could be seen glowing in the dark, and in most cases after the current was shut off they were found to be dead.

It was noticed in both seasons that the potato haulms under the network kept green much longer than those on the control portion.

Although the percentage increase in 1918 was less than in the previous year, it is to be noted that the total yield was increased from 14.6 to 18.5 tons, and although the treatment during 1917 only lasted seven weeks, as compared with three months during 1918, the decrease might be explained by the smaller area of network wire in 1918; but it should also be noted that, owing to the network in 1918 being arranged at right angles to that of 1917 (see sketch), about one-quarter of the 1918 control portion had been under the network the previous year.

It was unfortunate that, owing to the weather being so wet during the gathering of the 1918 crop, it was not possible to weigh separately the potatoes taken from each quarter of the field.

Cost of Equipment.

Transformer of 10 kv.a. 400/120,000 v. .	£204 0 0
3-h.p. synchronous motor for rectifier. . . .	55 0 0

£259 0 0

Making rectifier arms, etc., approx. . . .	£41 0 0
--	---------

£300 0 0

It is estimated that this equipment could easily deal with 100 to 150 acres.

Two-Acre Voltage Equipment.

Galvanized steel wire	£2 8 0
Supporting wire, steel, say	2 0 0
Sapling poles, insulators, say eight at 10s. .	4 0 0
Labor, say.	4 0 0

£12 8 0

A "Danger Notice" was kept at the gate of the field warning people of the high voltage, and this probably had a deterrent effect on prospective thieves, but did not prevent a big cart-horse breaking through the hedge during 1917, which afterwards received a shock, departing with a good portion of the network attached to it. The horse did not return, but we understand that it was undamaged. This year a sheep dog got under the network, and after receiving a shock through its tail, it departed very hurriedly, making loud noises, and also did not return. Our informants are not sure what ill-effects it received, but say they certainly knew its voice was in good order whilst it was within hearing!

In an adjoining field, in 1918, an experiment was made on a crop of oats, but owing to various difficulties it was not possible to carry it out thoroughly. The results seemed to point to an approximate increase of 35 per cent. in grain and an increase of 17 per cent. in straw.

Theo. P. Shonts, president of the Interboro Rapid Transit Company, which operates the subway and elevated lines in the boroughs of Manhattan and the Bronx, New York, states, in a letter to the municipal government, that unless an eight-cent fare is granted the company faces bankruptcy.

Historical Review of Steam Turbine Progress

The Westinghouse Electric and Manufacturing Company has just issued their Circular 1591, entitled "An Historical Review of Steam Turbine Progress." This publication was written by Mr. Francis Hodgkinson, whose commercial and engineering knowledge of the steam turbine is perhaps as broad as that of any man in America. The circular is a reprint of an article which appeared serially and is now gathered together in one publication with the intention of becoming a handbook on steam turbine progress. The early history of steam turbine engineering is gone into and the earlier machines installed in America are illustrated. From 1899 until 1917, each year's development is properly illustrated with views of all the different types of impulse and reaction turbines and the construction of blading, valve chamber, governor, throttle valve, coupling and oil cooler are shown in detail. This publication should be a valuable addition to designing and consulting engineers. It is being used extensively, we understand, in the Government training classes for junior engineers on steam engineering work.

And Toronto's Mayor, Too

Shoes are up, beef is up,

Bread is out of sight;

Plumber puts his prices up—

People say "all right."

Ink is up, paper up,

"Comics" add a half;

Papers boost their prices up—

Patrons stand the gaff.

Rails are up, coal is up,

Crews demand more wages;

Trolley people ask relief—

Papers froth with rage.

O-B Bulletin.

The International Paper Company, New York, have completed plans for the development of the Rapides des Forges, Three Rivers, Que., in connection with proposed newsprint and pulp mills to be erected by the company at Three Rivers. The plan of the hydro-electric development includes seven units each of 7,500 h.p. part of the power being available for the purpose of other manufacturers. The directors of the company have not yet come to a final decision as to the carrying out of the scheme.

The Bill of the Levis County Railway Co. (recently re-organized) has been before the Railway Committee of the Quebec Legislature. The company obtained franchises for 20 years from the municipalities of Levis, St. Romauld, Bienville, and Lauzon, but they were not ratified by the electors and the requisite legislative authority is now sought. The rates are to be 25c for six and four tickets, with a cash fare of 10c. This was protested against, but the committee left the question to the Quebec Utilities Commission to be decided on should there be an appeal to that body. Tickets, placards, etc., are to be in the two languages, and the cars of the one-man control type.

At the annual meeting of the Ottawa Branch of the Engineering Institute of Canada, held in Ottawa, on January 9th, the following officers were elected for the calendar year 1919: R. deB. Corriveau, chairman; J. B. Chalmers, Secretary; and as members of the Managing Committee, Messrs. A. F. Macallum, C. N. Monsarrat, J. Blizard and G. B. Dodge.

The Contractor-Dealer

The Dawn of a New Era in Electrical Merchandising—Large Manufacturing and Jobbing Company Place Expert at Disposal of the Members of the Contractor-Dealers' Association in Toronto

There are already signs that Mr. Goodwin's visit to Toronto, as reported in our last issue, is bearing fruit. At that time one of his recommendations was the employment of a skilled "merchandiser" who should make the rounds of the electric stores, offering suggestions, giving advice, answering questions and, if necessary, taking charge of this or that store for a day or two at a time. Whether or not as a direct result of this visit, it is very satisfactory to note that the Canadian General Electric Company, looking to the general development of the trade, has already named an expert window dresser and retail sales organizer, whose services are to be placed at the disposal of the electric stores without charge. It is understood the scheme will be tried out first in Toronto and then gradually extended as its usefulness is better understood and its results proven.

We cannot but feel that this is a great big step in the right direction. No doubt this one company will feel that it is not called upon to carry all the load which will automatically shift, in all probability, to the shoulders of the whole electrical manufacturers' association. Indeed it would seem to be an expense that should best be borne by the manufacturers, jobbers and central stations operating together, since each of these elements in the trade is vitally interested in boosting the sales of electrical equipment and, therefore, in seeing that the methods of merchandising adopted by the contractor-dealers and others handling this equipment, are of the most modern.

The Announcement

The Canadian General Electric Company have sent out the following announcement:

Toronto, February 25, 1919.

Toronto Members Ontario Association of Electrical Contractors and dealers:—

Re: Window Dressing and Show Window Displays

Dear Sirs,—When Mr. Goodwin was here in Toronto he commented rather severely on the general appearance of the show windows and display rooms of the electrical dealers and contractors.

We all appreciate that the show window, if properly used, is an excellent salesman, and realizing that the average dealer with his many duties, cannot keep in close touch with the most up-to-date methods of display, etc., we have decided to inaugurate a new service (confined for the time being to Toronto members) in that we will offer the services of a special man to advise you of the best methods of dressing your windows, and arranging your showroom displays, and if necessary he will spend some time with you in arranging such displays.

Mr. Pollock, who will undertake this work, has had a great deal of experience in window dressing and displays, and we feel sure that you will find his suggestions and assistance of

value. If you care to partake of this service kindly communicate with Mr. H. E. Pollock of our Sales Department and he will visit your premises as soon as possible.

Yours very truly,

Canadian General Electric Company Limited.

A. S. Edgar,

Supply Sales Inspector.

Hamilton Dealers Organize

On February 17 the electrical contractors and dealers of Hamilton had a very successful organization meeting in the Royal Connaught Hotel. Eighteen members submitted their applications and paid their fees. A constitution was drawn up and adopted, the name of the new association determined upon being the Hamilton District Electrical Association. The following officers were elected: President, Mr. V. K. Stalford; vice-president, Mr. C. W. Chadwick; secretary, Mr. J. Culley; treasurer, Mr. Geo. Lowe; councillors, Messrs. W. C. Reid, W. Jack and L. H. Lander. It is proposed to hold luncheons periodically and have speakers address the members on timely subjects.

TO ALL ELECTRICAL MEN IN WESTERN CANADA

Manufacturers, Dealers, Central Station Men,
Etc., Etc.,

TAKE PRELIMINARY NOTICE

Under the auspices of the B. C. Association of
Electrical Contractors and Dealers,

A GIGANTIC ELECTRICAL CONVENTION

will be held in the City of Vancouver on May
26th and 27th next.

Chief speakers will be Samuel A. Chase,
Special Representative

Westinghouse Electric & Mfg. Co.,
and in all probability W. L. Goodwin,
Author of the Goodwin Plan.

Every electrical man everywhere is cordially
invited to join in this monster electrical gathering.
Wives are also specially invited.

In order to get on the mailing list drop a card
to the Secretary, 406 Yorkshire Bldg., Vancouver,
B. C.

Messrs. E. J. Philip & Sons have opened offices as consulting engineers in the Hamilton Trust Bldg., Toronto. Mr. E. J. Philip the senior member of the firm, has had an extensive engineering experience. He was for seven years manager of the gas, electric light and street railway systems at Kitchener, Ont., and four years manager of the gas, electric light and water systems at Brockville, Ont. He then became engaged in Government work, and has recently returned from Porto Rico, where he was emergency engineer in connection with the waterworks and filtration plants.

Price Differentiation on a Basis of Quantity and Service

By Mr. John J. Gibson*

The quantity principle of price differentiation is growing in favor because it is fundamentally right, and I shall not enumerate the reasons why, for they are known to you. But the application of the quantity principle may be made in several ways, and of these there are two which differ widely. One is to grade a buyer according to his potential buying power, and the other is to let him grade himself by the actual amount he buys at the time of each purchase. The first way includes the familiar "annual purchases" plan, with or without rebates. The simplest and best known form of the second is that of the "standard package."

These things are all so well known to you that I need not expatiate on them but need only mention them to set the stage for what I want to say about them. Making prices for consumers on a quantity basis involves no difficulty, but in the resale field a new element enters the case, and one that vitally interests you and every other resale factor in the industry. Compensation to a jobber or dealer for service rendered can be paid in only one practical way, and that is in the form of a discount or commission on the goods resold.

We need, therefore, to apply two discounts to get at what a resale factor should buy at, or, in reality, a single discount made up of two parts—one representing quantity and the other service rendered.

Present practice (with few exceptions) is to make resale discounts without regard to quantity and, in some cases, without regard to service. It is the easiest way. Even when we all know that there are many kinds and degrees of service rendered a resale factor to a manufacturer, we see the same discounts given to concerns whose services differ widely in character, amount and cost. We see also the same discounts given to concerns who do varying amounts of business. Surely, the larger volume deserves due consideration.

Why cannot these things be measured? They can, but is it worth while?

Is anything worth while? No political economist ever has advocated the "laissez faire" principle. While the other extreme of rigid control is equally objectionable, there is no doubt of the good common sense which recognizes things as it finds them and endeavors to regulate the disturbing elements in any situation by reasonable methods. Unrestricted competition is destructive. Monopoly, or the absolute elimination of competition is equally evil. Competition so regulated as to be fair and to be conducted on clearly defined lines is the very healthiest state of affairs in business.

It is worth while for us to measure resale service and to determine the part quantity handled is to play in arriving at proper compensation for a resale factor.

Compensation for Service

My subject has to do with quantity, but it is inseparably tied up with service, so it is necessary for the moment to analyze service briefly. Let us take your work. You sell. You carry warehouse stocks. You bill and collect. You investigate credits and carry financial risks. You advertise and display goods. Your service compensation should be and is the greatest of any resale factor in our business. But, should one of you do less than all the acts of service just outlined, should he have as great a compensation as that which is paid for all? And again, if one of you sells one-fifth or one-tenth of the quantity in any one line, is he as valuable

a distributor to the manufacturer of that line as another of you who sells five or ten times as much? Or, if one of you sells as much as another and does not render the full service, i.e., the other fellow carries stock and you do not, the other fellow advertises and you do not, or the other fellow sells without expensive help from the manufacturer while you do not, are you entitled to as good discounts as the other fellow? No. We all agree on this in theory, but in practice no difference is made. Just as in trade unions the poorest workman in a trade draws as big pay as the best, so in the electrical jobbing business the poorest jobber gets discounts as good as the best. The very fact that there is a present disposition to separate jobbers into two classes—jobbers and distributors—indicates that this truth is recognized by manufacturers, at least.

As a matter of fact, you do perform all of the forms of service with two exceptions. Let us dispose of the less important exception first. There are some things, poles for instance, which you sell on commission, doing no billing or collecting or taking no financial risk and having no warehouse expense. In the comparatively low commission sometimes accepted for such service you show your recognition of the service principles as a gauge of compensation. The other exception is more important and is vital to our argument. That lies in the case where you do not stock the goods but perform all the other forms of service. If one jobber stocks a line, should he get the same compensation as another who will not do so? Should not a part of your compensation be graded on the degree in which you render this warehousing service which is fundamentally the real function of a jobber? We start with the assumption of a basic service discount for all other service but warehousing.

Here is where quantity is in a sense a direct measure of service or at least a proportionate measure. This is indeed the most variable item of service in the electrical jobbing industry. A manufacturer can afford to give greater discounts to the jobber who stocks his goods and in proportion to the amount, the quantity or the single order governing price can be made an automatic regulator and one that would be just to both manufacturer and jobber. A quantity discount would give you an extra margin of gross profit which would justify your buying in stock quantities, and if you chose not to do so but chose to buy in hand to mouth quantities, or never pass the goods through your warehouse at all, such a schedule would not give you a margin of profit which you had not earned, the smaller quantities naturally bearing smaller discounts.

Is this not fair and should not dealers and contractors or others buy from you on the same basis?

Method of Measuring Quantity

Now as to the matter of measuring quantity. To use any other but a perfectly definite measure would be only to court trouble. Let us see, therefore, which of the two ways of measuring quantity is the more definite.

Potential annual distributing power as a basis of rating is a matter of judgment based on past records, or is an intelligent guess. Rebates provide the only guarantee of performance to meet promises. Regulation by rebates is expensive and not at all a simple matter to keep straight. The practical result of this plan is no differentiation at all. Evasion is too easy, particularly when the seller is weak. Absence of quantity differentiation in resale work throws a burden on the jobber which should not be his. If a dealer can buy one article for the same price as twenty the jobber he deals with must perforce bear the expense of filling orders for extremely small quantities with no extra price for the extra service, and no dealer will make his orders large under such circumstances. This is a simple illustration. The same principle applies when the figures are multiplied and

*Before Cleveland Convention of Electrical Supply Jobbers.

the bill of goods is more complicated. Annual buying power of a dealer would be a poor way of determining his prices when no two jobbers could or would agree on that annual quantity.

Now, let us take the other way—quantity on the single order governing price. It is definite. It cannot be the subject of a dispute at the time or later, non-cancellable orders only being considered. It gives the jobber the protection he needs against imposition in the way of small orders because it would put a price on such orders as would either compensate the jobber for the extra cost of handling or it would encourage the placing of larger orders in the right quantities.

Between the jobber and the manufacturer the case is the same. Quantity discounts properly calculated would regulate proper stocks and compensate both manufacturer and jobber for the expenses which vary with quantity. Naturally the principle would have to be in operation in all sales schedules—manufacturer or jobber, to dealer, to user, with

basic service differentials between them, of course, to get the best and fairest results. The jobber could not be expected to fill small orders at low prices and replenish his stock in like amounts at high cost. Consistency is necessary here as in all things for success and satisfaction.

Quantity on the single order determining price is free from uncertainty. Doubt as to how a competitor rates a buyer or a dealer or a jobber, disappears if you are sure he can get no price but that which his single order entitles him to. And, indeed, under such circumstances sales schedules need never be kept secret. Why therefore, should not the electrical jobbing industry of the country be in favor of this principle? There is no reason. Many jobbers I have talked to admit this theory to be correct but hesitate for obvious reasons to try a plan not used by everyone in the business.

Such a plan would stimulate quantity, eliminate the low-priced small orders and stabilize the market by substituting a certain definite measure for one open to dispute and misinterpretation. These reasons should appeal to you.

Putting the Electric Shop in Order

Is your electric shop just as you would like it to be—location right, windows attractive, interior well planned, and organization smooth running? The Society for Electrical Development offers some splendid suggestions in their February "Sales Service," urging the contractor-dealer not to rest content until he has classified, analyzed and corrected every business weakness that comes to light. The suggestions take the form of questions, sort of heart-to-heart talks the dealer may have with himself, and run as follows:

About Your Business Location

1—(a) Is the value of your location being impaired or improved by the trend of residential and business development?

(b) Is trade taking a channel that leads into other sections or centres?

2—(a) If it is being impaired, are you taking steps to offset that detriment?

(b) Have you attempted to analyze why this is?

(c) Have you ever made a real analysis of trade-buying activities, to learn the "How, Why, When, Where" of your retail trade channels?

3—If your location is being made more valuable, are you taking full advantage of your added opportunities?

4—(a) Can your customers and prospects find you easily, or is it difficult for them to locate your place of business?

(b) Are you advertising your location to fix it firmly in customers' minds—doesn't it need it?

5—Have you checked up your competitors and other retailers to ascertain how they have studied the question of "location" and made the best of their opportunities?

About Your Display Windows and the Use You are Making of Them

1—(a) Could you improve your windows by altering them? If so would not the expense be more than justified by the increased effectiveness of your windows?

(b) Are they too small?

(c) Are they properly lighted?

(d) Do they display the goods to fullest advantage?

(e) Do they allow sufficient light within the store?

2—Do you just "throw" a few devices or supplies into your windows, "letting it go at that;" or do you plan your displays carefully and with due regard to the seasons?

3—Do you make a point of studying the "other fellow's

windows" and profiting by the knowledge gained thereby?

4—Do you observe the first rule of all good window display practice—to change your trims at least once in every two weeks?

5—Do you study and use the monthly suggestions for displays reproduced in the Society's Sales Service? Do you make fullest use of the display material furnished by the manufacturers?

6—Is the lighting of your windows a credit to your position in the Electrical Industry?

7—Do you keep the windows clean and spotless? Do you observe a regular schedule for cleaning them as well as changing trims?

8—Do you ever solicit the suggestion of women-folks, in making up your displays?

About The Interior Of Your Shop

1—Is the shop swept and dusted regularly, and are the appliances on display kept looking spic and span?

2—Is the lighting system such as to properly illuminate your goods as well as the store interior and show them off to the best advantage?

3—Are there ample Convenience Service Outlets available for use in demonstrating lamps and appliances of every character?

4—Are there samples of supplies and fixtures on display where they can be pointed to by those who chance not to know them by name and are, therefore, at a loss to make their wants known? And are these items so cataloged that you can locate your stock promptly?

5—Do you segregate your stock in one section of the shop or store, your fixtures in another, your appliances in another and heavier household devices in still another? Or is everything jumbled together?

6—Are the appliances equipped with price and cost-to-operate tags, such as those furnished by the Society?

7—Are seats available for the comfort of customers who may desire a demonstration of washers, cleaners, and so on?

8—Have you endeavored to impart to your shop a distinctive note, something unique in lighting, or arrangement, or color scheme, or customer's convenience—something, whatever it may be, that will make and retain a place for itself in the minds of your customers?

1—Are your business operations governed by a policy

that can be expressed definitely and in so many words? Have you so expressed it, and do you refer to it for guidance? Or are you going along more or less blindly, deciding each thing as it comes up, instead of settling the conduct of routine of affairs once and for all by establishing principles and policies?

2—If you do have an established business policy, are you then conducting your business accordingly?

3—If you are not doing so what excuse can you offer yourself for not either changing your policy to conform to your business activities, or changing your activities to conform to your policy?

About Your Accounting And Cost Keeping

1—Is yours merely a hit-or-miss bookkeeping system, or do you maintain comprehensive cost accounting and cost finding systems?

2—Are you familiar with the recently completed "Standardized Cost Accounting Plan" as described in detail in the November issue of the Sales Service? Is your present system as complete and satisfactory in all respects as this?

3—Does your system enable you to keep accurate track of your overhead in all its details and to apportion it accurately in establishing prices for goods and for service? Are you sure, in other words, that you are figuring everything in the way of costs that should enter into a bill or the price of an appliance?

4—Are you sure that all your operations are a source of profit, or is it possible that a more accurate and searching cost-finding method would expose many leaks in your business that you are unaware of today?

5—Do you employ simplified estimate and proposal forms in soliciting business, and do you keep accurate records of all estimates and proposals submitted?

6—Does your system include the keeping of a perpetual inventory of goods and supplies in stock, and do you have an accurate method of keeping track of the amount of material sent out on a job, the amount used and the amount returned?

7—Does your accounting system afford you a daily or weekly understanding of the exact status of your business?

8—Can you prepare readily and in satisfactory form a statement of your business such as banks and credit managers require?

About Your Selling Methods And Your Selling Talent

1—Do all who sell for you understand that electrical appliances should be sold for what they will do, rather than for what they are—do they, in other words, sell the "idea" rather than the mere appliance itself?

2—When demonstrating an appliance, do they state the cost in cents-per-hour-to-operate? Or do they confuse the customer by talking "watts, amperes, ohms," and other "Greek" terms?

3—Are they able to state in simple, non-technical language the scope and character of service that each appliance performs, and show wherein and how the service of the appliance will satisfy the customer's needs?

4—Are they well grounded in the fundamentals of selling? How do you know that they are? Have you ever made it your business to find out? Have you ever supplied them with printed sales helps such as the S. E. D. booklets "How to Sell An Idea," or "Buying A Cause And Paying For Effect," and others published by manufacturers? Are they making improvement in their knowledge and practice of selling?

5—Do you ask the Society for specific assistance for helping your sales people improve their ability to sell?

6—Do you supply your sales people with the incentive

of an assured increase in income in return for improvements in their selling methods and results? Could you improve your selling conditions by compensating your help on a different basis—for instance, an equitable profit-sharing basis, or an automatic increase in income in return for an increase in sales?

Do your sales people as well as yourself benefit by the selling suggestions and assistance by the Society and manufacturers?

Advertising

1—Do you set aside a definite sum, or a percentage of your gross business, to be spent for advertising? Or do you follow the haphazard practice of advertising only when it strikes your fancy to do so?

2—(a) Have you ever had your advertising policy and your advertising copy analyzed and criticized constructively by competent authorities?

(b) Are you satisfied that those things are as good as they well could be?

(c) Do you make use of the advertising suggestions and illustrations supplied by the Society?

3—Is the impression that one naturally would receive from reading your advertising in keeping with the impressions received when your store is visited? That is to say, if in your advertising you talk of service, prompt attention, courteous treatment, trustworthy advice regarding the selection of appliances, and so on, do you make good on those statements?

4—Do you keep a scrap-book of your advertisements to show when and where they appeared, and such items as their cost, the temperature and state of weather, the sales of the items mentioned in the advertisements? Do you then make a business of studying that information to discover how your advertising can best be improved?

5—Do you receive any helpful service from newspapers in your city? Do you look to them for help that they usually extend to their advertisers?

6—Do you study your fellow-dealers' advertising and endeavor to make your advertising superior?

General

1—(a) Have you ascertained what should be considered a fair "turnover" in your business and are you keeping up with that standard? Could it be bettered?

2—Have you any tried and tested plans for getting rid of dead stock?

3—(a) Have you ever analyzed the actual purchasing power of your community?

(b) Do you gauge your business by the estimated percentage of business you secure against what the figures say you should get, or are you content to judge the current year's business by the percentage of increase shown over that for the preceding year?

4—When things go wrong in your business do you hunt until you find the cause of the trouble, and then take steps to correct it? Or do you believe in "letting well enough alone?"

5—Each week do you reserve a period to dismiss from your mind routine matters and do some real constructive planning for the betterment of your business?

6—(a) Are you a member of the local and national trade organizations, and, if so, do you make use of the benefits and opportunities such membership affords?

(b) Are you a good "mixer" in a business sense in your community?

7—Are you making full and complete use of the Society's many facilities for helping you to effect improvements in your business? If not, why not do so for 1919?

Hardware Stores Handling Electrical Goods

Discussing the question of hardware stores handling electrical appliances, Mr. Edgar, Canadian General Electric Company, speaking before the Hardware Retailers' Convention, in Hamilton, recently, said:

"The question has been asked, time and time again—should the hardware store sell electrical merchandise? The electrical dealers answer 'no,' and the hardware dealer says 'we must.' And then both sides proceed with arguments and incidents to prove whatever they desire. As a matter of fact, both are wrong and both are right. It is true that some hardware dealers have carried on their electrical merchandising activities in a manner prejudicial to the electrical dealer's interests. It is also true that in many communities electrical merchandising would have become virtually stagnant if it were not for the aggressiveness of the central station and the hardware dealer.

"The whole matter, as it seems to me, simmers down to this—there is no valid reason why the hardware store should not merchandise electrical appliances and other supplies provided that they deliver with each piece of electrical merchandise sold, a certain amount of electrical knowledge. The electrical merchant has that knowledge and if the hardware man expects to compete with him, both he and his salesmen must acquire sufficient knowledge of electrical supplies to intelligently conduct the electrical end of his business. For instance, a hardware dealer sells a toaster. He tells the purchaser it can be operated for 2 cents a day, and the statement is believed. The purchaser takes his toaster home and places it in continuous operation to heat a small chicken coop, with the result that the following month his light bill is \$32.00. Many instances might be quoted where electrical supplies are merchandised in this way by dealers unfamiliar with the appliances or the cost of operation, but if the hardware dealer would take some pains to inform himself and his salesmen, regarding the more staple electrical supplies, there is no doubt that the hardware dealer, with his advanced selling methods, would become a big factor in the distribution of the more staple electrical supplies.

"It would pay the hardware dealer to get in touch with the manufacturers of small motors and electrically operated devices used in the home. This is a time of great economy. There are many thousands of electrically driven labor saving devices being sold each year and this number is increasing in spite of the increased cost of living, due solely to the fact that they are reliable labor-savers. It will be found that the sale of each new appliance, rather than exhausting the field, creates additional customers by practical education. It is to be hoped that the hardware dealer who undertakes the selling of electrical merchandise will himself become thoroughly educated to the use and operation of the many staple lines which can be handled to advantage by the hardware dealer, as a correct knowledge of these lines is absolutely essential to assure the success of his merchandising efforts in this direction."

Even the Architect Sees Humor in This

The specification of the architect, so far as the electrical installation in buildings is concerned, has always been more or less a handicap to the electrical contractor and the following example, prepared we understand by an architect, would seem to indicate that they are at last beginning to realize the humor of the situation they themselves have created and maintained for so long. The title is: Specifications of wire-pulling in connection with a girl's residence in....

General Conditions

Objects.—As the primary object of the electrical installation is the amusement of the inmates, the workmen shall

use all diligence in regaling the girls with gruesome stories of death by electrocution, whether by lightning, in the chair, by accident or for pleasure. They shall also give them a thorough knowledge of the theory of electricity and enable them to define offhand the difference between direct currents and Valencia raisins.

Board.—The board under which this work shall be done is composed of twenty-four members, each one of whom has a distinct, separate, and different idea as to how the work shall proceed. The contractor, under a heavy penalty, shall absolutely guarantee satisfaction to each individual member as well as to the board collectively. Failure to accomplish this will abrogate any liability whatever on the part of the architect as to the issuance of a final certificate.

Voting.—In the case of a tie-vote between any two, four, six, eight, ten or twenty members, the President shall have the casting vote as to how the work shall be done, after which the workmen will proceed to do it as they damn please.

Foreman.—The foreman shall not only provide heavy bonds, but shall also wear a chain and ball as a repressive measure against his inevitable desire to abduct, elope with, abscond with or otherwise to get away with the pretty secretary of the board.

Treasury.—The treasury will not be guarded. If it is not dishonestly robbed during the progress of the works it will sure be honestly robbed at the conclusion of the job, so in any event the till will be empty.

Soldering Irons.—Soldering irons may be used in connection with the work, but their use shall in no case be diverted to the curling of the girls' hair. Nothing but soft solder shall be used, and to facilitate the smooth running of the job it shall be handed to the matron in large quantities.

Switches.—Only one switch will be required and this shall remain in the hands of the matron for the chastisement of any girl who may attempt to electrify the workmen by flashes from her eyes.

Inspection.—The work, as usual, will be inspected by the Hydro, and if the building be burned down through faulty installation the inspector will require no further evidence that the work is defective, and may order its immediate removal.

Electric Club of Toronto

The Electric Club of Toronto held their usual weekly luncheons on February 14, 21 and 28. The speakers on the various occasions were: On February 14, James T. Gunn, whose topic was: "Labor's Relation to Reconstruction Problems." On the 21st, Professor C. A. Chant, of the University of Toronto, spoke on "Some Recent Developments in Astronomy," and on the 28th Captain Frank Johnson described some of his experiences in motor transport work in France. The attendance is very gratifying, running as high as 150. The paid-up membership to date is 180.

Admiral Jellicoe's Message

The primary cause of the shameful surrender of the German fleet was the loss of morale on the part of the personnel. This was brought about by the strangling effect of sea power on sea communications and the knowledge gained at Jutland that this power was irresistible. The significance of this to an Empire which is absolutely dependent on sea power for its communications is obvious. The lesson to the Empire is that we should never allow our sea power to be called into question. It is our Life Blood.

(Sgd) Jellicoe.

How I Increased My Sales 100 Per Cent

A short time ago I decided to try and increase my sales of electric washing machines.

First, I went very carefully over the list of "female help wanted" advertisements in the evening papers and from the names made four lists as follows:

(1) The housewife who wants a general servant and says nothing in her advertisement about "washing done out."

(2) The advertisements for washwomen for the well-to-do houses.

(3) The advertisements for washwomen for the salaried people.

(4) The advertisement for washwomen for the mechanics and artisans.

The addresses of the advertisers assisted me to locate and divide the classes. Promptly next morning I mailed freshly written letters of which the following models give the import of the idea. These letters showed a cut of the washing machine I handled and the wording varied with the class of customer to whom I was appealing.

To the First Class:

Dear Madam,—You advertised in last night's paper for a general servant. Is she to do the whole or any part of the washing? If she is, there is one way you can keep her and keep her contented.

Have an Electric Washer installed before the prospective domestic arrives. Then before she can get one-half way through her list of the perquisites you must give her, the number of afternoons and evenings off, the Sunday privileges etc., phone to us and say: "Is that (insert your telephone number) speaking?" We answer "Yes." You say "All right, this is Mrs. (name) speaking; that will suit me very nicely."

Before the prospective maid has finished her just (?) demands, our demonstrator is entering (as pre-arranged) your back door, has slipped down to the laundry, is sitting on a chair reading the paper while the Electric Washer demonstrates to the prospective domestic, whom you presently lead in, that there is no work at all in washing.

You will be getting replies to that advertisement shortly after you get this letter. Hadn't you better phone us at once to "carry on?"

Yours for Better Service.

Suggested Letter for Fourth Class:

Dear Madam,—We notice by your advertisement in last night's (paper) that you are again without a domestic to do your washing. Believe me you cannot keep them unless you follow the path of least resistance.

We will be pleased to send you on trial an Electric Washer, or demonstrate same at our shop (give address). We guarantee the Electric Washer and Wringer does all the work—literally every bit of it. The domestic is really the engineer.

There is much satisfaction and great gain, as your husband knows, by having the engine all ready before the engineer arrives. Our phone is (insert number).

Yours truly,

Then I was careful that the man (or woman) sent out as demonstrator knew how to do a washing just like a Chinaman. An inexperienced demonstrator is worse than none for all the mistakes are blamed on the machine. Also a man or woman who thinks it is beneath his dignity to know all about the little details of washday is an n.g. salesman.

There is no reason in the wide world why washing ma-

chines cannot be placed in practically every home. Don't talk price. Don't even worry about selling the machine, but sell, rather, a washing well done, in short time, with a minimum of labor. Create the desire to own this thing which does such satisfactory work and the sales follow as a matter of course.

High Voltage Generators for Radio Communication

For use in continuous-wave radio work the Westinghouse Electric & Manufacturing Co. has manufactured a number of types of small direct-current machines, which have been used by the Signal Corps for communication in France, and by the Navy. One of these is a two-commutator generator, giving direct current at 27 volts, 2.5 amp. to light the filaments of three-element vacuum tubes, and at 280 volts, 80 milli-amp. for the output circuit of vacuum tubes used to

Airplane Generator

generate continuous high-frequency oscillations. This generator is mounted on the landing-gear of an airplane, so that the back-wash of the propellor drives the generator by means of a small two-blade wooden fan. Thus the generator runs whenever the plane is in motion, and also when it is on the ground with the engine running. Constant voltage with variable speed is secured by an ingenious arrangement of differential fields controlled by a two-element vacuum tube mounted in the streamline housing at the rear of the machine. This generator furnishes power for sending and receiving radio-telephone messages between airplanes, and between airplanes and the ground.

Square D Company Markets New Switch

There are some outstanding features in the new switch known as Ninety-Six Two Eleven, just put on the market by the Square D Company, Detroit, Mich. An investigation carried on by this company disclosed the fact that there is an enormous market for a switch of this type. This fact led to production of the switch in large quantities, reducing manufacturing costs and resulting in a low selling price. The new

switch is shown in the accompanying illustrations. The switch is a 30 ampere, 125 volt unit, using Edison plug fuses. The current carrying parts are enclosed in a cabinet made of 16 gauge steel. Switch is operated by a handle on the outside of the box. The box is equipped with a hasp so that the cover may be locked preventing access to live parts by any except authorized persons. A lock-off device permits locking the switch in the "off" position when this becomes necessary. No. 96211 bears the combined fire and accident label of the Underwriters' Laboratories.

Notable Advance in the Design of Westinghouse Fans

Advances have been made in the design of Westinghouse single phase alternating-current induction motors for 12 and 16 inch fans. The new design gives a wider range of operating speeds than has hitherto been found possible even with a split phase winding, which uses reactance and resistance coils to secure a modified form of three-phase current, and requires considerable energy in the resistance and reactance coils without corresponding gain in the efficiency of the motor. A current transformer is used in the base of the

12 in. Oscillating Fan

motor in place of a choke coil. The starting winding is energized by this transformer and is in circuit continuously, no centrifugal switch being used. The design of this transformer makes it possible to vary the speed of the motor within wide limits without sacrificing the starting voltage and therefore, the starting torque. The primary of the transformer is in series with the main winding and the secondary in series with the starting winding. With this connection the motor receives two separate currents with large displacement which gives the necessary torque for starting the motor, and little loss

when running at full speed. The motor, by using a series transformer instead of a choke coil, is receiving two currents out of phase with each other, and consequently operates as a polyphase motor of a two phase type. Such a motor has a torque at any speed down to zero, consequently the fan load may be operated at any point desired.

The following shows a comparison of the performance of the 12 inch fan motor with series transformer control, with one with a choke coil control:

Transformer Control		
Speed	Watts	Starting Volts
High, 1,550 r. p. m.	50	66
Medium, 1,300 r. p. m.	39.5	70
Low, 1,030 r. p. m.	32	80

Speed change, 520 r. p. m.

Choke Coil Control

Speed	Watts	Starting Volts
High, 1,645 r. p. m.	45.5	56
Medium, 1,510 r. p. m.	40.0	80
Low, 1,415 r. p. m.	39	90

Speed change, 225 r. p. m.

The comparison shows a considerably greater speed change with the series transformer control and a further advantage in the starting voltage. This type of winding eliminates the use of the centrifugal switch used with the choke coil. The change renders the motor less liable to injury through lack of attention and careless handling. The power input is slightly greater, but the efficiency is increased accordingly with the added advantage of a greater change, and the impossibility of burning out the starting winding of the motor. The choke coil, using reactance and resistance, wasted energy in the coils without a corresponding gain in efficiency.

The Imperial Trading Co.

Further evidence of deep faith in the future of Canada and Canadian commerce is furnished by another new company, recently formed, the Imperial Trading Company, with head offices in the Herald building, Montreal. This company intends to deal in iron, steel, copper, brass lead, spelter, and other metals; in rails; railway equipment; motors, generators, transformers, and machine shop tools; wool felt, cotton waste and other textile products, also pulp mill and mining machinery. The company is also negotiating for a number of sole agencies for Canada, of important products from the Orient, including China, Japan, East Indies, Malay States, India, Ceylon, Indo-China, Straits Settlements, etc. The president is Major G. A. E. Bury, son of Sir George Bury. Major Bury, before joining the overseas forces, was a prominent barrister in Winnipeg; he returned to Canada recently after over three years with the Canadian expeditionary force; he is a graduate of the University of Manitoba. The vice-president and general manager is Mr. E. C. Peterson, formerly district manager of the Northern Electric Company, Limited. Prior to that, he was in charge of the production department of the Western Electric Company, Chicago, with which he began his business career in September, 1899, immediately after graduating from the Iowa State College, in mechanical and electrical engineering, receiving the degree, B. Sc.

Personal

Mr. Ernest Oliver, Toronto, has been appointed superintendent of the Toronto, Niagara & St. Catharines electric railway by the Board of Directors of the Canadian National Railways.

Mr. Geo. J. Nelson, B.Sc., for many years chief draughtsman for Mr. R. S. Kelsch, consulting engineer, Montreal, is recovering from a severe attack of pneumonia. He will soon be able to resume his duties.

Mr. Lawford Grant, who has severed his connection with the Eugene F. Phillips Electrical Works, Ltd., was, on February 8, entertained at dinner at the Engineers' Club, Montreal, by the staff of the company, and presented with a mahogany clock.

Captain F. R. Glover, assistant general manager B.C.E.R. Company, has resumed his duties after an absence of nearly three years. Before returning to Canada last year, Captain Glover was in France with the Canadian forces, his regiment participating in the Vimy Ridge battle. For the past year he has been superintending the Dominion police activities, in connection with the Military Service Act, in British Columbia.

MONTREAL

Branches : Toronto, Winnipeg, Regina, Calgary Vancouver

Current News Notes

Hastings, Ont.

A new Hydro transmission line has been proposed from Healy's Falls, to serve the municipalities of Havelock, Belmont, Norwood, Hastings, Keene and Westwood. The line, if constructed, would also serve as an auxiliary source of power to the city of Peterboro.

Markham, Ont.

A by-law was recently passed in Markham, Ont., authorizing an expenditure of \$5,000 on alterations and additions to the electric plant.

Montmagny, Que.

The town of Montmagny has been authorised by the Quebec Legislature to develop hydro-electric power and to sell current. A proposal to start a street railway was defeated.

Montreal, Que.

Messrs. Smart & Burnett, consulting engineers, Montreal, have been retained by the Canadian Rolling Mills Co., Ltd., Montreal, to re-organize their power distributing system.

The Montreal City Council has passed a resolution to the effect that as the cost of lighting and electric power is high in Montreal the city commissioners be requested to submit the question to the Public Utilities Commission, so as to obtain, if possible, a reduction in price of electricity in Montreal.

A privately promoted Bill having for its object the repeal of the contract between the City of Montreal and the Tramways Company received only two votes in the Private Bills Committee of the Quebec Legislative Assembly. The Bill also provided for the appointment of a commission to prepare a fresh contract between the city and the company, and further that any franchise or modification of existing franchise to a public utility company in Montreal should be granted only by the direct representatives of the electors. The City Council supported the main provisions of the Bill, having always opposed the action of the Quebec Government in taking the initiative in the matter of the contract now in force.

New Westminster, B. C.

The Tudhope Electric Motors Company, New Westminster, B. C., is proceeding with a plant for converting metal scraps by the use of the electric furnace.

Parry Sound, Ont.

With a view to extending local industry at Parry Sound it has been proposed to enlarge the municipal electric system so as to be able to supply light and power at cheaper rates.

Perth, Ont.

Hydro power was turned on in Perth, Ont., on February 19. Pending the completion of the High Falls plant, power is supplied from Merrickville. While only the factories are at present being served, it is intended to cover the whole town in the near future.

Quebec, Que.

For the first time, the Public Service Corporation, of Quebec, has published an annual statement. This shows gross of \$242,335 and expenses and taxes \$150,714, leaving net earnings of \$91,621. Interest on the bonds took \$25,000. The balance of \$66,621 remaining as net profit, is carried forward to surplus, bringing the total surplus to \$68,759. From this

the directors set aside \$25,000 to depreciation of plant, \$20,000 to reserve account, and \$4,000 to reserve for repairs, etc. After some minor deductions a balance of \$18,159 was carried forward in profit and loss.

Regina, Sask.

It is estimated that about 8,000 miles of new rural telephone lines and extensions will be constructed by the Saskatchewan Government this year.

St. Catharines, Ont.

The annual report of the St. Catharines Hydro-electric System shows earnings amounting to \$145,845, compared with \$117,190 last year. Expenses amounted to \$111,576, as compared with \$84,409 last year. The net surplus is \$24,031 as against \$22,980 last year. Total assets amount to \$370,713 and liabilities \$255,689.

Three Rivers, Que.

The International Paper Company, N. Y., have completed plans for the development of the Rapides des Forges, Three Rivers, P. Q., in connection with proposed newsprint and pulp mills to be erected by the company at Three Rivers. The plan of the hydro-electric development includes seven units, each of 7,500 h.p., part of the power being available for the purposes of other manufacturers.

Vancouver, B. C.

Domestic lighting rates in the suburbs of Vancouver—Point Grey, South Vancouver and North Vancouver—have been cut approximately 1½ cent per kw.h. The rate is now about 7½ cents.

The city council of Vancouver, B. C., have resolved to cancel the agreement granting permission to the B.C.E.R. Company to collect six cent fares within the city limits. A public utilities board is being formed and under the provisions of the public utilities act the rate of fare existing would remain stationary until investigated by the new board. The city council believe this might take any length of time up to a year and so have decided that after April 8 their agreement shall be terminated and the matter of an increase left to the public utilities board.

Winnipeg, Man.

Premier Norris, of Manitoba, has announced an early installation of automatic telephones in Winnipeg as part of a million dollar extension programme proposed by the provincial government.

Shipment of the first two of the ten new cars ordered by the Winnipeg Electric Railway Company last June, has been made, and the remaining eight will follow at short intervals. These cars are being supplied by the Ottawa Car Company, Ottawa.

The annual report of the Winnipeg Electric Railway Company, for the year ending December 31, 1918, has just been published and shows gross earnings amounting to \$3,588,723. Operating expenses amounted to \$2,412,226. After adding miscellaneous revenue there was an amount of \$1,221,428 to meet fixed and other charges which amounted to \$931,644, leaving a balance of \$289,784, excluding depreciation.

The eleventh report of the Manitoba Government Telephones has just been issued and shows total assets of \$13,510,403. The plant is valued at \$9,695,892. The total number of services at the end of the year 1918 was 51,760, a gain of 2,853. The total revenue was \$2,003,307, operating expenses \$1,493,899 and net surplus \$18,766. The number of employees at the close of the year was 1,225. Payments for the year to employees on active service amounted to \$41,012 and although operating expenses increased by \$142,834 for the year, no increase in rate for service was found necessary.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

10 to 35 h.p. Give particulars and price to St. Mary's Wood Specialty Co., Ltd., St. Mary's, Ont.

Induction Motors Wanted

One each 15, 25, 35, 50 H.P., 550 volt, 60 cycle, 2 phase. Would consider other voltages or three phase. State full particulars and best cash price. Address Box 843, Electrical News, Toronto, Ont. 3-t.f.

For Sale

1 150 H.P. Corliss Steam Engine, made by Cowan & Co., Galt, Ont. Girder frame, left hand drive, side crank, 13' x 26" fly wheel.

Will sell at a bargain.

Full particulars on application to

Hydro Electric Commission,

5-t.f. of St. Thomas, Ont.

Equipment For Sale

We have for sale the following second-hand electrical machinery in good condition, with accessories.

4 Grinder motors, 450 H.P., 250 R.P.M., starting electrical resistance, drum controller.

6 Water cooled transformers, 375 K.W., 12,000 volt primary, 440 volt secondary.

1 Paper machine motor, 125 H.P., 500 R.P.M., 440 volt.

1 Installation high tension cable.

1 Paper machine motor, 100 H.P., 500 R.P.M., 440 volt.

1 Incoming line panel, switches, transformers, etc.

1 12,000 volt aluminum cell lightning transformer.

Delivered F.O.B. cars, Thorold, Ont.

Address: Natural Resource Corporation,
538 Gluck Building,

5-t.f. Niagara Falls, New York.

Induction Motors Wanted

The following 3 phase, 60 cycle, 550 volt, new or used, Induction Motors, are wanted:

16 Squirrel Cage, with auto-starters and approved control switch, ranging from 10 to 100 H.P.

25 Wound Rotor motors with non-reversible drum controller, ranging from 25 to 150 H.P.

1 Variable Speed Motor, 10 H.P., speed 600 to 1200 R.P.M.

All the above motors are to be impregnated and constructed to resist dampness and acid fumes.

Full particulars, giving types, maker's name, delivery and place of inspection, age and condition, may be forwarded to Box 876, Electrical News, Toronto. 5

WANTED

Engineering Graduate

preferably with electrical training and knowing French, as Montreal representative of engineering publications.

Apply by letter,

Hugh C. MacLean, Ltd.

347 Adelaide St. West

Toronto.

Put a Light on the Bed

Plenty of people who live in homes that do not have electric lights are interested in a means of quick light at night, a light that can be turned on without having to grope for a match. Many people who have electrically lighted homes will be glad to know how they can have a light within reach of the bed where they can turn it on without having to get up in the dark to reach a switch. These people will be interested by such a display as the following:

If the window is a big one, get a standard size single bed. If the window is smaller, get a crib. If the crib is too large, get a doll's bed. On the bedpost of this bed, of whatever size it may be, attach a flash-lamp by means of a suitable clamp, in such a position that it can be reached by a person in bed, and the button pressed to turn on the light.

Pushing the Vibrator

The sale of vibrators useful for massage and complexion purposes can be pushed by a window display featuring pictures of pretty girls.

Collect a lot of magazine covers and inside pages showing actresses or other pretty girls. When enough of these have been collected to cover the background of the window and make an effective showing, arrange them artistically, not merely put up in rows, but framed up with mats cut out of fancy colored papers. Then make your display of the vibrators with a card explaining their use as complexion aids, and incidentally for other purposes. Put up a big card reading, "Complexions Made Beautiful" with the sub-title, "with the help of a vibrator. Why use harmful cosmetics."

It is very likely that it will be better to emphasize here the vibrator idea and put the soft pedal on "Electricity" because some people feel a little afraid to use electricity in this form, especially if they have never had any experience of that kind. Do away with any idea of there being anything mysterious about the device in appealing to such people, as otherwise they may be afraid of it. If you are appealing to a class of trade that is familiar with all sorts of electric appliances, just the opposite may be true and you may bear hard on the idea that electricity will help the complexion through the medium of the vibrator, thus capitalizing the faith some have in the power of electricity to accomplish almost anything.—Electrical Merchandising.

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

**Spaulding
HARD FIBRE**

This resolution has started many manufacturers towards better and more economical production. Take the various parts of your machine or specialties, no matter what other materials they are now made of. Send them to us. We tell you what parts could be advantageously made of Spaulding Hard Fibre.

Spaulding Hard Fibre is rapidly replacing iron, steel, brass, copper, rubber, wood, leather, raw-hide, porcelain and other materials.

Send in your parts—tell us what they are used for and how much they are costing you. Our recommendations may save you money.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating informa-
tion no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamil-
ton, Ont.; London, Ont.; Montreal, Que.;
Ottawa, Ont.; Quebec, Que.; St. John, N.B.;
Toronto, Ont.; Vancouver, B.C.; Victoria,
B.C.; Winnipeg, Man.; Calgary, Alta.; Ed-
monton, Alta.

Solderless Connection

Insulating Shell and Cap

Patented Canada 1917.
Patent Pending U. S.
and Foreign countries.

Ring Out The Old Ring In The New

Ring out the old troublesome method of making connections; Ring in the new Walger way—for it saves 80% of your time.

The WALGER INSULATED WIRE CONNECTOR does away with blow torch, alcohol, solder, acid, rubber, tape and paste. All that is needed to make the connection secure is a screwdriver. Wireman can carry enough connectors in his pocket to to wire up the fixtures for a whole house, and having them connected the Walger way eliminates the danger of defacing walls or ceilings, or soiling fixtures. Makes inspection **sure** and easy. Approved by Underwriters' Laboratories, Chicago, and Hydro-Electric Power Commission, Ontario, Canada. For No. 12 wire and under.

Ask your Jobber for prices and discounts or write

A BUSINESS-GETTER

for 1919

TAKE a census of the families in your neighborhood using electricity—count the small stores, shops and other buildings so lighted—add the number of buildings now being, or soon to be erected which must be wired for electric current. *Then* you can get some idea of the market that awaits you on the Ninety-six Two Eleven.

This 96211 is a 30-ampere, 25-volt safety switch of standard Square D quality, to be used in every place where you previously used the ordinary switch of this capacity. All live parts are enclosed—switch is operated from outside of box—can be locked or sealed and is provided with lock-off device.

A universal market calls for maximum production. This lowers manufacturing costs and permits the lowest price at which a safety switch has ever been sold.

Lists at only \$2.25—and there's a Square D jobber near you prepared to quote substantial discounts.

Manufacturers of

INSULADUCT

A flexible conduit that **is flexible** and **remains flexible** under all climatic conditions.

"INSULADUCT" is approved by the Underwriters' National Electric Association. Every coil bears the Underwriters' label and every foot of conduit has the word "**Insuladuct**" stamped in the lining.

"INSULADUCT" is made in six sizes, **5/16"**, **3/8"**, **1/2"**, **5/8"**, **3/4"** and **1"**, is shipped in fibre boxes and reaches its destination in prime condition.

"INSULADUCT" is a Canadian product that has no superiors and few if any equals. If your Jobber does not sell it, write direct to the factory.

Westinghouse

Turnover Toasters

Toasts at the table:—Turning the insulated knob turns the toast. No danger of burning the fingers.

It is unnecessary to touch the bread from the time it is put on the rack until it is taken off toasted.

The flat surface on top of the toaster will keep the toast warm, keep the coffee-pot hot or heat plates.

Electric Irons

concentrate all heat at the ironing surface, radiation from the top is prevented by a dead air-space.—A heat storage plate holds the heat, making the iron stay hot longer. The heat is distributed over the entire ironing surface.

---	---------------------------------------	---	-------------------------------------	--	---	--	--	---

This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission

They use it for
STREET LIGHTING

Now the fact that it is used by the Hydro Electric Commission is proof that it is all we claim for it. It certainly is not an experiment, by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

Generation, Transmission and Application of Electricity

The Home of
Northern Electric **DURADUCT**
Reg. Can. Patent Office

The Conduit with the Roller-Bearing Wireway

For Protection Use

Oil Switches and Circuit Breakers

Maximum Amperes, 800

TYPE D-13

Maximum Volts, 27,000

Application

D-13 oil switches and circuit breakers are used for controlling and protecting generators, feeder circuits, transformer banks, etc. Their sturdy construction, high factor of insulation, and ability to interrupt large amounts of energy make them highly desirable for controlling and protecting apparatus and circuits, where uninterrupted service is of extreme importance.

CONDIT D-13 oil switches and circuit breakers are made in single, two, three and four poles for manual remote control or electrical operation. They are furnished in 300, 500 and 800 ampere capacity for pressures of 15,000 volts or less, for capacities of 300 and 500 amperes where the pressure does not exceed 25,000, and for capacity of 300 amperes at 27,000 volts. The D-13 oil switch and circuit breaker is adapted for flat surface mounting on either wall or in cells, or it may be mounted on pipe frame structures. The design of the switch structure and operating mechanism is such as to afford the usual mounting arrangements met with in standard practice.

MANUALLY OPERATED—REMOTE CONTROL—27,000 VOLTS—200 AMPERES

Construction

The face plates are neat and well finished. The handles are substantial and of good appearance, and are so arranged that they drop automatically to the open position when the circuit breaker opens, thus affording visual indication of the position of the movable contact members within the tank.

All automatic forms may be provided with undervoltage, shunt trip and time-limit attachments. Auxiliary switches of the circuit opening or circuit-closing type may also be utilized in connection with either the non-automatic or automatic form.

All automatic type D-13 overload circuit breakers have their trip coils and calibration adjustments on the front of the switchboard and the mechanism is arranged to prevent the operator from holding the switch closed during an overload or short circuit.

Some of the important features which characterize CONDIT D-13 oil switches and circuit breakers are the efficient laminated brush, the reversible and easily removable auxiliary arcing tips, the self-aligning, sure-seating action between the movable contact members and the stationary contact members, the rugged "tank per pole" construction, high head of oil over break, large expansion chamber and the strong spring action inherent in the CONDIT brushes, which facilitates rapid acceleration of the movable contact members on the initial opening of the circuit.

"National Protection"

RUST PROOF—ACID PROOF

A SHERARDIZED surface absolutely protects against rust. By the sherardizing process, the zinc is not merely applied as an enamel to the surface, but is *alloyed with the steel* and becomes a part of it. And more than that, the interior surface is given the same superior zinc protective treatment as the exterior.

A clear acid and alkali proof enamel is then baked on the Sherarduct and affords the best protection to the underlying surfaces against the destructive action of gases and acids. This enamel coating is also applied to the interior surface.

Both surfaces of Sherarduct are sherardized and enameled. "National" Protection is Double Protection. Write for Descriptive Bulletin No. 50.

THE 1919 EDITION

POCKET SIZE
LEATHER COVER

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or A. C. single, two or three-phase.

OUTSIDE—How to make line construction, line wires, service wires, poles and their dimensions and Insulators, guard arms, guy wires, and how to install Lightning arresters.

weights, and how to erect and protect them and anchors. Tree wiring, splicing, service and other matters. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to wire. How to find the proper size of wire for current, voltage and drop, either by formulae or by the tables of the book. How to wire for two-phase and three-phase with formulae and tables in a simple manner that anyone can understand. How to run wires through partitions and walls and where roundings exist. When and how to do it. How to take proper precautions. The proper way to install Outlet, Junction and Switch boxes. Complete interior conduit wiring. Concealed knob and tube wiring. Electric and combination wiring. How to use it. How to install.

LIGHT AND ILLUMINATION

Latest data on Mazda and other lamps and semi-indirect illumination. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

The most complete and accurate Book on Wiring and Construction published

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

O-B Form 1 Trolley Base

Dark parts are renewable bushings.

Two Big Advantages of O-B Trolley Base

Uniform Pressure

Turning a screw adjusts the O-B Trolley Base to hold the wheel to the wire with the pressure which is right for your conditions.

That pressure is maintained with practically no variations at all heights of the wire—always enough to keep wheel on wire without undue strain on base, car roof or line.

Renewable Wearing Parts

Most of the wear is absorbed by steel bushings in the O-B Trolley Base (see illustration).

When it is necessary the bushings are easily, quickly, cheaply renewed. The whole base is made nearly as good as new.

O-B Bases have many other valuable characteristics. They pivot freely. They can carry current far in excess of any service requirements. They are accessible, easy to lubricate, sturdy.

Ask for a trial—at our expense—on your own cars.

A Window Display which will Sell Fans For You

The show window if properly used, is the dealer's best advertising medium. It can be made to tell the sales story in the most effective way and it reaches the prospect at a time when it is easy for him to step inside and see the product advertised.

In the 1919 R&M Fan window cut-out we have produced one of the most effective displays we have ever offered our

dealers. The figures are life-size and reproduced handsomely in eight colors.

The breeze from a Fan in operation causes the streamers in the baby's hands to flutter, giving the motion which adds so much to the attracting power of a window display.

This display and a complete line of other advertising helps are furnished free to R&M dealers. Complete information sent on request.

Returned Technical Men Being Properly Cared For

Since our issue of March 1, which announced the opening of a clearing house for returned technical men in Toronto at 287 Queen Street West, this office has been placed in charge of Major R. D. Galbraith, late of the Canadian Machine Gun Corps and Canadian Railway troops. The credit of the idea of these bureaus, we understand, belongs to the Joint Committee of Technical Organizations, who are also still acting in an advisory capacity to the Government. In Toronto the Joint Committee have undertaken to stand behind the organization and lend their assistance in bringing the returned technical men into contact with employers of technical labor and, to this end, have sent out the following letter to manufacturers, contractors, municipalities, etc. Present indications we understand, are to the effect that the bureaus will meet with a ready co-operation of employers and that the supply is not likely to greatly exceed the demand in any line of technical work. The letter is self-explanatory:

Re: Re-employment of Technical Engineers who Have Been Overseas

As you are doubtless aware, the Dominion Government has recently established a large number of labor employment offices in various Canadian centres, through which returned soldiers and employers are being brought in touch with one another.

As it appeared most desirable that returned technical

men should also be assisted to get in touch with the openings, for which their training and experience specially fit them, we approached the Dominion Government, with the result that employment bureaus, known as Professional and Business Occupation Sections, are being opened in Toronto, and a number of other centres throughout Canada. These offices will be in charge of returned engineer officers, who will have the necessary data regarding the qualifications, experience, etc., of the returned technical men on file, this information being secured while the men are in transit. The men will also report to the office in their district and see that the information is supplemented where necessary.

The Toronto Office has been opened at 287 Queen Street, West, and is in charge of Major R. D. Galbraith, recently returned from overseas.

Our object in addressing this letter to you is to advise you of the facts as above, and to invite you to communicate to Major Galbraith the particulars of any vacancy or probable vacancies in your staff requiring men with technical training. We respectfully urge that this matter receive your immediate attention.

We trust that this movement to re-establish the technical returned man in the work for which he is best fitted, and where he can be of the greatest use to his country, will receive your warmest co-operation.

Yours very truly,

Wills MacLachlan,

Secretary,
J. C. T. O.

Note.—As indicating the co-operation of local business men, we are authorized to use the names of the following gentlemen, who have expressed their entire approval of this scheme and undertaken to give it their hearty support.

C. N. Candee—General Manager Gutta Percha & Rubber Co.

F. G. Clark—Chief Engineer Toronto Power Company.

E. L. Cousins—Chief Engineer and General Manager Toronto Harbor Commission.

H. H. Couzens—General Manager Toronto Hydro-electric System.

F. A. Gaby—Chief Engineer Hydro-electric Power Commission of Ontario.

R. C. Harris—Commissioner of Works, Toronto.

G. G. S. Lindsay—Barrister, Toronto.

Senator Nicholls—President and General Manager Canadian General Electric Co.

W. A. McLean—Deputy Minister of Highways, Province of Ontario.

Telephone Men and Signallers in the War

"Without the help of the telephone men and signallers at the front we could not have won the war," said Brigadier-General W. O. H. Doods, in speaking at the Montreal Electrical Luncheon on March 5. The General's talk was on "Telephones at the Front," and was a description of the telephone system in connection with artillery. He told of the absence of this equipment when the Canadians were mobilized, and to illustrate the difficulty of getting telephones in the early days of the war mentioned that it was easier to replace a disabled 18 pounder gun than it was to get telephones. In the early part of 1915 all wires were laid overland. As showing the dangerous and splendid work of the linemen, the General stated that these men won more honors than any other section of the artillery. In June, 1915, the brigades were loaned some Ericsson telephones which proved very efficient. Supplies of wire were difficult to secure, either of D1 or D3, and weekly reports had to be made of the quantities used and those on hand. In July,

1915, they obtained a wireless mast—this serving four Brigades. At the beginning of the war the signallers had little knowledge of the Morse code, relying mainly on the semaphore. Later the signallers became much more efficient in the use of the Morse code.

Originally signal communication was in the hands of the adjutant, then it was transferred to the orderly officer, and eventually was put in charge of the Canadian engineers, who laid out the system. Much improvement was also carried out in the matter of burying the wires, enabling the artillery to open fire very promptly. The switchboard equipment was made more efficient as the war progressed. The four-way switchboards were increased to eight-way boards, and by the fall of 1916 there was an issue of the regular sixteen-way French switchboard, in addition to which the eight-way boards made by the signallers were used as auxiliaries. Bell telephones were used to communicate with the Brigade headquarters, but not in the front line.

At the Somme the Canadians did splendid work in burying the wires whilst under fire. In 1917 the signalling system was improved in every way. At Vimy Ridge, in 1917, the communication was absolutely perfect, and the men were able to speak a distance of 50 miles back. The first battle of Amiens was an open fight, and here air lines, it was found, were not destroyed as quickly as the lines laid along the ground. There was no occasion to bury the lines owing to the rapidity of the fight. Lines were laid as the troops advanced to enable communication to be made with headquarters, and in this connection portable wireless outfits proved of great value.

Means were taken to prevent the enemy from picking up messages on the telephone wires, one telephone being so constructed that it was impossible for the Hun to pick up any communication with his listening apparatus. The men were told not to rely absolutely on the telephone. Experience, however, proved that they were forced to do this, and that it was the lamps and flags which fell down, and not the telephone.

Joint Committee Annual Meeting March 24

The Joint Committee of Technical Organizations will hold their annual meeting in the Physics Building Theatre of the University of Toronto on Monday, March 24, at 8 p.m. The programme will consist of President Geo. A. McCarthy's annual report, in which he will outline the activities of this organization during the past year, which, we understand, have been very extensive. This will be followed by an address by Mr. H. J. Daly, on the subject, "Industrial Economics—the Employer's Standpoint." Mr. Daly has come into particular prominence as Director of Repatriation for the Dominion Government, which office he recently resigned, and is one of the best known industrial figures in the Dominion. The labor standpoint will be presented by Mr. Tom Moore, President Trades and Labor Council of Canada, who will speak on "Industrial Efficiency—From the Labor Standpoint." Mr. Moore is known as a labor man with very broad and sound ideas, and recognized as one of the outstanding figures in the solution of the problems confronting us at the present day of bringing labor and capital into closer working relationship.

The Canadian Drill and Chuck Company, Limited, Toronto, has been taken over by Mr. H. P. Ash, late manager of the Royal Bank, Welland, Ont., and will be known as "The Canadian Drill and Electric Box Company." The business, which is located at 1402 Queen Street East, Toronto, will be under the management of Mr. Harley W. Morden, who is well known in the electric trade.

Toronto Section A.I.E.E.

Report of meeting held at the Engineers' Club on Friday, March 7, 1919.

The Chairman introduced the subject for discussion, which was "The Future Organization of Electrical Engineers in Canada." He pointed out that electrical engineers in this country were insufficiently organized, especially in matters affecting their relations with the Government. Greater activity could be expected in electrical matters if we were organized on a national basis, at the same time maintaining our connection with the A. I. E. E. The A. I. E. E. had not openly pushed the formation of branches in Canada, but this work could be undertaken on a larger scale by a proposed Canadian I. E. E. in co-operation with the American Institute.

Mr. Wills MacLachlan reported having had a talk with the A. I. E. E. authorities in New York more than two years before, when he suggested that a Canadian I. E. E. would ultimately grow out of the sections in Canada. He found that the directors of the A. I. E. E. were quite sympathetic with the idea. In February last, following a suggestion from the Toronto section, a special committee was appointed by the president of the A. I. E. E. to consider and report upon the formation of a Canadian institute as outlined above. Any technical organization should embrace the following features if it were to be an efficient body.

- (a) Interchange of technical ideas.
- (b) Furthering of the interests of members.
- (c) Service to the community.
- (d) Recognition of engineering status of members.

All of these could be more perfectly obtained through a Canadian Institute of Electrical Engineers than through a branch of a U. S. organization.

Mr. H. H. Couzens raised the question whether the scope of the proposed society was to be purely technical; if so he thought this would limit its field too much. What we seemed to need was a new society to co-ordinate existing electrical societies, including the business element, and bringing them all together in matters of general and public policy, with its consequent advantages of greater publicity. He would be glad to see the manufacturer, jobber, contractor and financier of electrical interests brought under one governing electrical body which would provide a nucleus for their, at present, somewhat scattered activities. What present organization can fulfil these ends? Not the Engineering Institute of Canada, because membership is barred except to professional engineers. The Canadian Mining Institute, for example, has a better policy in permitting non-engineers to join the association if they are in any way interested in mining work. A new organization would have the valuable opportunity of doing the same thing for electrical engineers and electrical men generally.

Mr. W. Volkman showed that it was quite practical for a Canadian society to work harmoniously in affiliation with a U. S. body. The Canadian Electrical Association was started 28 years ago, and 8 years ago it affiliated with the N. E. L. A. By this means members of the C. E. A. were entitled to all the advantages of both societies and to get the benefit of the literature published and the work done in the U. S. The President of each body was a director of the other. The Canadian Electrical Association retains its status as a distinct Canadian body although for the purpose of mailing and organization it is referred to by the N. E. L. A. as a geographical section.

Mr. S. L. B. Lines, on being appealed to, stated that he believed the South African I. E. E. to be working quite satisfactorily in affiliation with the British I. E. E. He thought that the proposals for the institution of a Canadian I. E. E. did not go far enough; he would like to see it as

Canadian as possible and not too closely tied up to a foreign organization.

Mr. E. V. Pannell pointed out that it was hardly possible as a first step to sever connections with the A. I. E. E. in New York. In the first place all our members rated their advantages very highly, especially the proceedings and transactions. Furthermore, the autonomy proposed was complete enough for all practical purposes. As a matter of interest it might be mentioned that of the annual dues of about \$10.00 per member, \$5.00 was spent in editing and printing the proceedings; and a further \$1.50 in printing the transactions. It might be thought advisable at some future time to sacrifice the latter in order that we might apply the allotment to better uses.

Mr. W. A. Bucke was quite in sympathy with the idea of a Canadian Institute as proposed; he thought that the next step further would result in an entirely Canadian engineering association which should be our ideal. It was undesirable that any change should be made in the membership dues.

Professor H. W. Price opposed the suggestion that the transactions might have to be sacrificed. He thought them of very great value.

Mr. H. U. Hart had recently attended the annual meeting of the Engineering Institute of Canada at Ottawa and had a talk with Professor Comfort A. Adams, the president of the A. I. E. E. there. He believed that the president was in sympathy with our ideas, and that the A. I. E. E. would help us to the fullest possible extent to get our own organization.

Mr. A. H. Harkness (Engineering Institute of Canada) had been asked to attend the meeting by Mr. Keith, the secretary of the E. I. C. He was glad to see the effort of the electrical engineers to have their own national body, but would call attention to the advantages of the Engineering Institute. The change in name from the Canadian Society of Civil Engineers was accompanied by a complete change of policy, by which all engineers were eligible to become members. A separate Canadian I. E. E. would result in dividing the forces of the engineers. The E. I. C. was studying the matter of taking legislative action to protect the position of the engineer and this was needed just as much by electrical men as by professional men of other branches of engineering. He acknowledged the value of the technical advantages derived from the A. I. E. E. which would be continued by the proposed Canadian I. E. E., but believed that the social and political value of the E. I. C. was even greater. The present practice of the E. I. C. was to have electrical, mechanical and other sections at their various branches. These sections should, of course, be general throughout the whole institute and not confined to the branches.

Mr. Wills Maclachlan said that this scheme of section-alizing the Engineering Institute of Canada so that electrical and other non-civil engineers would be on an equal plane was approaching the ideal, but that it did not exist and the E. I. C. constitution did not permit of it. It was far better for the formation of the Canadian I. E. E. to go ahead and await any change in the constitution of the Engineering Institute of Canada, which would make it more attractive for electrical engineers than it was at present.

Professor Gillespie (Engineering Institute of Canada) believed that the Engineering Institute provided the natural society for all kinds of engineers, and that although it manifestly did not offer the technical advantages received at present from the A. I. E. E. the Canadian members ought to support it. Quite recently the E. I. C. had to memorialize the Ontario Parliament on a matter of legislation affecting all engineers. He did not think that more than one engineering society in Canada could be supported. The

nationalization of railways and other extensive engineering works would mean that increasing numbers of engineers were coming under Government employ, and this would be a factor in favor of the Engineering Institute.

Mr. A. E. Davison thought that the men best qualified to give an opinion on this subject were the consulting engineers. He felt that the formation of the Canadian I. E. E. was a step in the right direction, and thought that the matter of federation with other engineering societies might follow at a later stage.

Mr. E. B. Merrill had long felt the anomalous position of being in the purely local section of a United States society. He believed the proposed change to be advantageous.

Mr. John Murphy claimed responsibility for the original suggestion to change the name of the Canadian Society of Civil Engineers. He had primarily joined this society to keep out of jail, because he found it was impossible to practice as an engineer in Quebec except by being a member of the society. As the Engineering Institute of Canada it had changed its constitution very thoroughly and he thought time was opportune for a further change which might appeal to the electrical engineers of Canada.

Mr. W. P. Dobson repeated that the technical advantages of the A. I. E. E. were far beyond those of the E. I. C. as far as electrical engineers were concerned, and he would never think of dropping membership in the former in favor of the latter.

Mr. P. A. Borden endorsed this view. He was also opposed to the formation of a small society which would be entirely dissociated from others.

Mr. A. H. Winter Joyner thought that the British I. E. E. should not be neglected when affiliation was being considered. He believed that their proceedings were very valuable and that when affiliations of the proposed Canadian I. E. E. were being thought of attention should not be concentrated upon any one society to the exclusion of other societies.

Mr. S. L. B. Lines, in answer to a question by the chairman, stated that an attempt had been made some years ago to found a branch of the I. E. E. in Canada, but it had to be abandoned partly owing to the small number of members in the country and partly owing to the war.

Mr. Wills Maclachlan then moved the following resolution:—

"That this meeting is in favor of a committee being formed to consider and report upon the forming of a Canadian Institute of Electrical Engineers which shall be in affiliation with the American Institute of Electrical Engineers and possible affiliation with other engineering bodies."

Mr. Dobson seconded the motion.

Mr. W. A. Bucke moved an amendment adding the words: "And that due consideration be given to the strong advisability of affiliation with the Engineering Institute of Canada."

Professor H. W. Price seconded.

Mr. H. C. Don Carlos strongly criticized the amendment. He was confident that the Engineering Institute had not made out a case, showing how such an affiliation would be of any advantage to the electrical engineers.

Mr. S. L. B. Lines asked what was understood by the United Engineering Society in the States. Was this an association open to all engineers, like the Engineering Institute of Canada? If so it would seem that we ought to follow their lead and join or affiliate with the E. I. C.

Mr. Willis Maclachlan pointed out that the United Engineering Society was nothing of this kind. It was a committee on which sat representatives from the four main en-

gineering societies: Electrical, Mining, Mechanical and, latterly, Civil.

On being put to the meeting the amendment was lost, as follows: For, 4; Against, 35. The voting on the motion was: For, 39; Against, 0.

Mr. A. E. Davison was in favor of getting the opinion of the meeting as to whether it might be advisable for the proposed Canadian I. E. E. to federate with other national bodies on an equal basis.

Mr. H. C. Don Carlos moved that it is the opinion of this meeting that there should be a national organization of engineering societies in Canada.

Mr. A. E. Davison seconded and the suggestion carried unanimously.

The meeting adjourned with a vote of thanks to the members of the E. I. C., who had taken the trouble to be present and join in the discussion.

Public Utility Accidents

The more we study the cause of accidents, the more evident it becomes that most accidents are preventable. Hence the paramount importance of such propaganda as that being carried on by the Ontario Safety League and the Accident Prevention Departments of the Electrical Employers' Association and the Ontario Hydro Electric System. Further valuable records are now to hand in a recent paper by Mr. E. M. Davis, Statistician, Utilities Mutual Insurance Co., in a recent issue of the *Electrical World*. Mr. Davis' company has confined itself exclusively to public utility business and gives the statistics regarding the analysis of some 1,170 cases over a two-year period.

Delay Necessary in Arriving at Cost of Accidents

It is a peculiarity of the compensation business that the exact cost of an accident cannot be immediately known, as in the case of a fire loss, since the injured employee must receive compensation until he is able to return to work, and this is always an indefinite period, because no one is in a position to know just when the return to work will occur. As a consequence, it necessitates the study of the accidents that have occurred in a more or less remote period, and the Utilities Mutual Insurance Company has therefore only recently made this study of its first two years' experience.

This survey involved 1,172 accidents occurring between June 30, 1914, and June 30, 1916, and is a complete record of the accidents incurred by those public utility companies insuring with the Utilities Mutual. Most of these companies were electric companies, although there were numerous gas companies and a few street railways. Of these 1,172 cases, full payment had been made on all but ten and the cases had been closed, but these ten involve continuing disability or continuing dependency, so that their actual and final cost could not be absolutely determined, although estimates could be made which would very closely approximate the actual cost.

The total number of days lost per accident is certainly a very fair indicator of the seriousness of the accident; but from a purely business basis the more satisfactory figure, and the one harder to obtain, is the cost of each accident.

The percentage of total days lost chargeable to each accident according to occupation shows that over 94 per cent of the lost time among public utilities is assignable to seven different occupations—linemen, laborers, firemen, switchboard operators, groundmen, carpenters, painters and masons (these three being grouped together) and locomotive engineers—and it is noticeable in this regard that these seven classifications each include one or more fatalities. It may, there-

fore, be quite positively stated that in public utility operations fatalities are the ones to guard against, particularly when the last three classifications—linemen, laborers and firemen—where a total of twelve deaths is recorded out of sixteen and where the total days lost amounted to 72.8 per cent of the entire lost time, are considered.

It may be finally boiled down to a bare statement that in public utilities laborers and linemen account for 58.62 per cent of the total time lost due to accidents, while they account for 49.05 per cent in respect to the cost.

Five Classifications Cover Causes

The analysis of these 1,172 accidents as to cause shows that explosives, electricity, fires and hot and corrosive substances; falls of persons; boilers and steam-pressure apparatus, machinery and handling objects account for more than 95.85 per cent of the total time lost, and it is found that these five classifications contain all of the fatalities reported in the two-year period.

In respect to the total cost, there is a slight rearrangement of the classifications again, as shown by the following: Days lost—explosive, electricity, etc., falls of persons, boilers and steam apparatus, machinery, handling objects; cost—falls of persons, explosives, electricity, etc., boilers, and steam-pressure apparatus, handling objects, machinery.

These five classifications account for 82.80 per cent of the cost of accidents, and aside perhaps from the classification "falling objects," which contributed 5.41 per cent of the cost, it may be said that these five classifications are the ones that should receive the greatest attention.

Summarizing, therefore, it may be definitely stated that the public utilities should exercise their greatest care for the protection of their employees, first, where linemen are concerned; second, among laborers; third, firemen; fourth, switchboard operators; fifth, groundmen; sixth, carpenters, painters and masons; seventh, locomotive engineers; They should particularly guard against accidents arising from the operation of, first, falls of persons; second, explosions, electricity, etc.; third, operation of boilers, steam, etc.; fourth, handling of objects; fifth, machinery. If conditions are still further analyzed, it may be positively stated that electric current and the boiler room are two of the three principal contributors to accidents among public utilities.

Such an analysis as the above should be the first study in accident prevention, and the second should be to provide the guards, the inspection service and the education to the employees to prevent these accidents. It is unquestionably true that the education is the very much more difficult portion of the work, but it cannot be intelligently undertaken unless such statistics as presented above have been accumulated.

As an indication of what the above facts mean, falls account for 13 per cent of the 1,172 accidents, or an actual number of 148; 24 per cent of the total lost time, or 33,000 working days, is assignable to this one cause, while 31 per cent of the total cost, or \$23,800, is contributed by falls alone. Again, linemen alone fell often enough to absorb 73 per cent of these 33,000 lost working days and 53 per cent of the cost, \$23,800. The moral of this is "Watch your step."

On the other hand, electricity contributed 11 per cent of the total number of cases, or 119 accidents: 40 per cent of the lost time, or 55,300 working days, and 24 per cent of the total cost, or \$18,400. Under the heading "electricity" linemen absorbed 23,000 days lost, at a cost of \$4,497; laborers in the plant 15,000 days lost, at a cost of \$5,200; switchboard operators, 7,900 days lost, at a cost of \$4,017, and wiremen 1,735 days lost at a cost of \$2,722. If, therefore, accidents to these four classes of workmen about public utility plants are eliminated, 85 per cent of these lost working days and 87 per cent of this accident cost will be saved.

The Characteristics of a House-Heating Power Load

By Mr. H. B. Dwight

The article on "Heating Our Homes with Electricity" in the *Electrical News* of February 1st, contains very valuable new data on this subject. Now that the coal shortage and the power shortage are practically over, the question which is of interest at present is not whether an entire city can be heated by electric energy, but whether residence heating is profitable at present rates for power, to both the householder and the power company.

Whether the automatic regulation of temperature, probably for each room separately, the absence of dust and the saving of cost of furnace attendance will be worth the extra cost of electric heating to a well-to-do householder, is a question that will be gradually settled.

The total cost of the energy for the installation described, for the season, at motor rates in Toronto, was \$260 or 0.50 cents per kw.-hr. The cost of doing the same heating by coal, including \$5.00 a month for the furnace man, is estimated in the article at \$179, which would be equivalent to 52,700 kw.-hrs. at 0.34 cents per kw.-hour. Now power has been sold in favorable localities at a rate nearly as low as this when it was sold in bulk, and with the voltages more or less unregulated. It, therefore, appears that in certain districts surrounding water power plants, electric power can at the present time, possibly, compete on a direct cost basis with anthracite coal and a furnace man.

There seems to be enough information already available to indicate that a residence heating load is at least as attractive to a power company as any ordinary motor load, and should command as low a rate. The total energy required to heat the residence described in the article of February 1st was 52,700 kw.-hours. The maximum rate was 26 h.p., or 19.4 kw., which, if used 24 hours a day and 365 days a year, would amount to 170,000 kw.-hours. Therefore, the yearly load-factor is $52,700/170,000 \times 100 = 31$ per cent. This is as good a yearly load-factor as that of any usual motor load, on which power rates are based. For instance, a motor, running at full load for 9 hours a day and $5\frac{1}{2}$ days a week has a yearly load-factor of only 30 per cent. It is therefore not fair to state that a residence heating load is a seasonal load and so cannot be given as low a rate as a motor load. It has so much better monthly load-factor during the winter, lasting as it does 24 hours a day and 7 days a week, that it can be idle all summer and still have a better yearly load-factor than an ordinary motor.

There are other advantages of a residence heating load, from the power company's point of view, than its good yearly load-factor shown by the Toronto experimental installation. First, it has 100 per cent. power-factor, while a motor load has usually from 85 to 90 per cent. power-factor. Second, where it is controlled by thermostats, the load is probably somewhat heavier at night than in the daytime, since the outdoor air temperature is then about 10 degrees lower, and the house is also not receiving energy by radiation from the sun. Third, a large voltage variation can be allowed without inconvenience with a heating load controlled by thermostats. The variation can be probably twice as great as can be allowed with motors, and several times as great as can be allowed with lighting. This would enable the distribution lines to be designed very economically, and would tend to counterbalance the fact that the load would be somewhat scattered in approximately 25 h.p. units. Fourth, a valley in the load curve lasting for several months is better for

the supply company than equivalent valleys of short duration occurring only at night.

It should be remarked that the data given by the Toronto installation confirm those given by E. R. Shirley in the *Electrical News* of May 15, 1918.

It would appear that the question of building up a residence heating load is worth investigating by power companies. Probably no better method of investigation can be used than that described in the *Electrical News* of February 1st, of making practical installations and keeping thorough records.

Bell Telephone and Increased Rates

The claims of the Bell Telephone Company of increased operating costs are borne out by the report for the year to December 31st last. While the revenue was \$1,048,383 better, operating expenses increased \$918,490, maintenance \$308,359, depreciation \$178,760, and taxes \$111,829, a total of \$1,517,338. Taking into account sundry earnings, the total net earnings decreased \$429,383. Mr. L. B. McFarlane, the president, points out that "the financial condition of the company made it desirable to restrict expansion within the limits of absolute necessity, and to continue the policy of development pertaining to war or war industries. Nevertheless, we show an increase of 18,944 stations during the year, and have met all such demands and other demands in the public interest. As showing the difficulty of procuring apparatus, it may be mentioned that it is necessary to order switchboards two years in advance to secure delivery. In 1918, 2,888 miles of wire were added to the long distance system. The long distance lines now owned and operated by the company comprise 85,303 miles of wire on 9,441 miles of poles, and 6,615 miles of wire in underground and submarine cables."

At the annual meeting the president alluded to the application for increased rates. He hinted that it might be found necessary to make an extensive inventory of the company's plant and equipment. This would take some two years to complete, but he hoped that the Railway Board will grant the company some temporary relief in the adoption of the new schedule formulated in the meantime. Mr. McFarlane pointed out that if this relief is forthcoming, the company's new budget, already drawn up, would be brought into force, and would result in a great deal of work throughout the company's plants and territory, this applying more particularly to new construction, telephone systems, and delayed maintenance. During the past four years, a great deal of work has, of necessity, been foregone, owing to the scarcity of labor, and the higher costs of all materials, including copper.

Impudence

The Niagara Falls "Review" very naively remarks: "There may be some truth in the statement that our local street railway line is not a money maker, but when taken over by the city the rate can be increased if necessary." And yet if the private owners asked for an increase in order to improve the service it would doubtless be called "impudence," following the precedent established by the mayor of Toronto.

The Saguenay Power Company, Chicoutimi, P.Q., has been incorporated with a capital of three million dollars, to construct and operate hydraulic, gas and electric plants, and to sell and transmit the power in the districts of Quebec, Chicoutimi, Roberval and Saguenay. Authority is also taken to carry on the business of a telegraph company.

The United States government has proposed a taxation on all United States capital invested in Canadian enterprises.

Electric Welding—Methods and Results

By F. Keith D'Alton, B.A.Sc.

Welding processes may be defined as the application of intense heat to effect the fusion of metals without causing any change in the chemical composition of the material. Concentration of the heat developed, with the consequent high temperature at the point of application is the most essential feature in the different processes.

At the present day various methods are used to produce this high temperature, but these may be divided into distinct classes depending on the manner in which the heat is produced—(a) by chemical action (b) by passing an electric current through resistance. The methods of welding by means of an electric current may in turn be sub-divided into two parts, which, although similar in theory, are vastly different in practice, namely, the resistance method and the electric arc process.

(a) By Chemical Action

Where chemical action is used to produce heat, the processes depend upon the combustion together of two gases under the most favorable conditions. The products of combustion must be gaseous and of such nature that they will not combine with, or otherwise affect the metals being welded or cut. The processes under this heading which are most commonly used employ the "Oxy-Hydrogen" or the "Oxy-Acetylene" flame.

The Oxy-Hydrogen Process

Hydrogen will combine chemically with oxygen to produce steam. To obtain complete combustion and the resultant highest possible temperature, the hydrogen gas must be mixed with oxygen in the proportion of two volumes of the former to one volume of the latter. Pure oxygen and pure hydrogen are manufactured and sold in separate tanks in which they are retained until used.

In the operation of this process the gases are led in separate tubes to a nozzle where they are mixed and ignited producing a flame at a temperature of approximately 3,500 degrees F.

As the gases are held under considerable pressure they emerge from the nozzle at a fairly high speed producing a long, narrow and very hot flame.

The Oxy-Acetylene Process

Acetylene, being a compound of carbon and hydrogen will disintegrate when affected by heat, and the elements forming it will each combine with oxygen producing respectively carbon dioxide and steam. To obtain complete combustion in this case, two parts of acetylene by volume are mixed with five parts of oxygen, and these combine, producing a flame with a temperature in the neighborhood of 6,300 degrees F.

In this process the gases are handled in much the same manner as in the oxy-hydrogen process; the main difference being that the acetylene gas is dissolved in acetone under pressure and as a result much more acetylene may be stored at a given pressure in a tank of a given size. Here, too, the gases emerge from the double nozzle with considerable velocity producing a long narrow and exceptionally hot flame.

As both these "chemical" processes produce a narrow flame, they may be very successfully used for the cutting of sheet metal, making, as they do, a clean narrow cut throughout the entire thickness of the metal.

It will be noted that the oxy-acetylene flame is hotter than the oxy-hydrogen flame; the reason for this being that acetylene gas is an endothermic compound, the dissociation

of the elements liberating considerable energy which also appears as heat and increases the temperature of the flame.

Acetylene can be manufactured much more cheaply than hydrogen; the fact that a good solvent for it is known and cheaply produced makes it much easier to handle; the flame resulting from the combustion of this gas with oxygen is much hotter than the oxy-hydrogen flame, and in consequence the oxy-acetylene process is replacing almost entirely the oxy-hydrogen processes in the practical application of welding and cutting in the various industries.

It must be noted here, however, that when welding or filling by either of the afore-described processes, it is necessary to feed in the metal required to do the filling. The fact that the gases come out of the nozzle under considerable pressure is somewhat of a disadvantage in welding, as it tends to spread the metal in the part being welded; but in cutting it is a decided advantage, as it helps to keep the cut clear by blowing the metal away as fast as it is melted.

Electrical Processes—The Resistance Method

In a process under this heading, the development of heat is obtained by the passage of an electric current through the parts to be welded or electrodes in contact with those parts. This process cannot be used for cutting.

The temperature can be controlled fairly easily since the heat is developed in the material and is proportional to the square of the current.

Welding, by this method, may be divided under three sub-headings, namely, butt-welding, spot welding and line welding. Butt-welding covers a class of work of the same nature as welding together the ends of bars or rods where the current passes through the bar longitudinally and through the contact between the bars. Contact resistance will undoubtedly cause a concentration of heat at the point of contact which, as it happens, is the place where most heat is required. The clamps used to connect the metal bars and the supply wires are usually of some metal having a good conductivity. Spot welding covers a very useful process used in welding together metal sheets where a continuous weld is not required. In this process the current is passed transversely through the sheets which are held tightly between carbon contacts. The heat is developed by the current passing through the resistance of the carbon blocks and no dependence is placed on the resistance of the metal sheets to develop any further heat.

This method is used only to hold the sheets together being in effect the equivalent of flush rivetting but it is a much simpler and cheaper process, as no laying out or drilling is required, but considerable difficulty is experienced in obtaining adhesion of plates due to the oxidation which occurs between them. This trouble does not occur with thick material, and may be prevented almost entirely in thin plates by ensuring contact under considerable pressure.

Only alternating current is used for this work, probably due to the flexibility of adjustment of such a source by means of transformers.

Line welding, being similar in process to spot welding, is equivalent to a series of spot welds or a line of rivets for strength, but possesses one great advantage over rivetting in ship construction in that the joint is absolutely watertight.

Electrical Processes—The Electric Arc Process

The electric arc welding and cutting processes depend for their attainment of high temperature on the arc which is

formed when a current passes through air or a region of metal vapors. Direct current is used most frequently, but alternating current has been used with more or less success. The method of operation of equipment as well as the results attained thereby, are so different from the corresponding characteristics of the d. c. equipment that it seems advisable to discuss each separately.

Direct current welding—The equipment required for direct current welding may be described under three headings, namely, the generator, the control equipment and the accessories. The generator is a special machine designed to deliver direct current at 60-75 volts, according to the current capacity which will be between 200 and 1,600 amperes. All generators used for this purpose are compound wound and may be part of a motor generator set or be belt driven from any capable source running at a constant speed. The amount of current delivered to the arc is regulated by resistances on the panel, there being also an automatic protective device, preventing overload on the generator.

The main switchboard is usually of slate and contains the generator control and the welding circuit equipment for one operator only.

One main board contains: 1 3-pole circuit breaker, 1 ammeter, 1 voltmeter, 1 field rheostat, 1 dial switch, 1 field switch, 1 protective relay, 1 contactor, 1 series rheostat (mounted separately).

Auxiliary panels are used in cases where extra welding circuits are required; these contain only the equipment necessary for one welding circuit namely:—1 double pole line switch, 1 ammeter, 1 protective relay, 1 dial switch, 1 series rheostat (mounted separately).

Protection of Eyes

Each outfit requires a number of accessories, some of which are necessary, chiefly on account of the injurious effect on the operator of the ultra violet rays produced by an arc between carbon and iron, or iron and iron. Continued exposure of the eyes to ultra violet light will result in total blindness. For the protection of the body clothing is sufficient.

In order that the eyes may not be injured, a mask is used. This consists of a fibre tube which will slip over the head, and in which is a glass window, whereby the operator may observe the work, but which will not transmit the ultra violet light. In some cases this mask is supplanted by a hand shield, which is often found to be more convenient, as it can be held in one hand and removed from in front of the face when the arc is stopped. It requires only one hand to operate the electrode.

Electrode holders of two types are used. These are much the same in pattern and purpose, but one type is for carbon electrodes and the other for the thin wire metallic electrode used in welding only. Either type is light in weight and easily handled, and consists of an insulated handle with hand shield and a clamp for holding the electrode.

As we have already stated two kinds of electrodes are used, i.e., carbon and metallic, the former being solid carbon or rather graphite, the latter being iron, copper or brass, according to the nature of the metal being welded.

Carbon electrodes are used mainly for cutting, since no filler is required in this process and the arc is more stable than with the metallic electrode. These carbons are manufactured in several sizes and are chosen according to the current which is to be used in the cutting process:

Current Used	Diameter of Electrode
100 amp.	$\frac{3}{4}$ "
300 amp.	$\frac{1}{2}$ "
500 amp.	$\frac{3}{4}$ "
1000 amp.	1"

Satisfactory cutting requires a current in excess of 200 amperes, a lower current being insufficient, but the 300 am-

pere outfit will do as good work as any higher capacity.

A low current density in the carbon will not heat up the electrode and the arc will have a tendency to travel around, whereas a high current density will overheat the carbon, causing it to burn away at an excessive rate.

The following table gives the sizes in which carbon electrodes are placed on the market by manufacturers:

Diameter—Length	Weight per 100 in lbs.
$\frac{1}{4}$ x 12	35
$\frac{3}{8}$ x 12	90
$\frac{1}{2}$ x 12	145
$\frac{5}{8}$ x 12	220
$\frac{3}{4}$ x 12	300
$\frac{3}{4}$ x 10	275
$\frac{7}{8}$ x 12	450
$\frac{7}{8}$ x 10	375
1 x 24	1200
1 x 16	800
1 x 12	600
1 x 10	490
1 x 9	440
1 x 8	390
1 x 6	295

Wasting of Carbons

If the electrode holder grips the carbon electrode at such a point that there is a long carbon between the handle and work, a strange action takes place. The carbon wastes uniformly throughout its length in such a manner that after a half hour's run it has assumed a new shape, being of its original length, but only about one-quarter of its original diameter. By readjustment of the holder, this trouble may be remedied.

The amount of carbon electrode used for cutting is quite variable, depending upon the current strength, method of clamping on the electrode, length of arc held, skill of the operator, etc.

Metallic electrodes are used for welding and filling only, for the melting electrode then assists in the operation.

For welding iron, the electrode is made of the purest iron that it is possible to obtain. It is in the form of round wire, of a diameter depending upon the thickness of metal being welded, which also determines the value of current to be used.

The following table covers "butt" welds in wrought iron and is copied from the G. E. Review, June 1917:—

Thickness of Metal	Diam. of Electrode	Speed Ft. per hour	Amperes	Mean k.w. at 60 v.
$\frac{1}{16}$	$\frac{1}{16}$	20	25-40	1.8
$\frac{1}{8}$	$\frac{1}{8}$	16	30-75	3.0
$\frac{1}{4}$	$\frac{1}{8}$ - $\frac{3}{16}$	10	70-125	6.0
$\frac{3}{8}$	$\frac{3}{16}$ - $\frac{1}{4}$	6.5	100-150	7.5
$\frac{1}{2}$	$\frac{1}{4}$	4.3	120-175	8.4
$\frac{5}{8}$	$\frac{1}{4}$	2.8	125-195	9.3
$\frac{3}{4}$	$\frac{1}{4}$	2.0	125-200	9.6
1"	$\frac{1}{4}$	1.4	125-200	9.6

Metallic electrodes are furnished either bare or flux-covered, as desired, but it is a question whether the flux covering is of any actual advantage.

Flux Covered Electrodes

The heat produces a small pool of molten metal on the parts to be welded, then additional metal is deposited in the molten state from the electrode. With the flux covered electrode, the flux melts with the arc and keeps the molten metal covered with a silicate slag which floats on the surface of the metal. It also surrounds the heated area with an inert gas, thus preventing possible oxidation. When cold, the solidified slag may easily be removed by a wire brush. The flux covered electrode does not demand as good regulation of the current as does the bare metallic electrode.

In describing in general the process of electric arc welding by means of a direct current outfit, it should first be noted that the material being welded forms the positive electrode, properly called the anode. The reason for this is that

considerably more heat is developed at the positive than at the negative electrode.

Slow action in welding may be due to reversed connections or to poor contact between the positive lead and the work.

The operator, having his machine running, adjusted to give normal voltage, with all circuits completed, has the electrode holder in one hand, while the other hand holds a face shield, or is free. In the electrode holder he places either a carbon or metallic electrode, depending on the class of work he is going to do. He touches the electrode to the "job" at the point where he wishes to weld or cut, and then draws back slightly, thus striking an arc.

In cutting, with carbon electrodes, the arc is usually drawn out to about 1 inch in length. No great skill is required in maintaining it as it is most stable.

Rate of Cutting

A 300 ampere outfit will cut steel at the rate of approximately $1\frac{1}{2}$ square inches of section per minute, i. e. $\frac{1}{2}$ inch plates can be cut at the rate of 3 inches per minute, 1 inch plates at $1\frac{1}{2}$ inches per minute, etc. This, however, varies slightly with the size of the section and the ease with which the molten metal can get out of the cut.

Equipments of other capacities will cut at a rate proportional to their capacity.

In welding, with metallic electrodes, a shorter arc is used and the current is adjusted to some suitable value, as shown in the last table given. During the welding action, the melting electrode is used as a filler in this way, making it possible to build up parts which have been broken or worn until the piece of work is of such size or shape that it may be machined to the desired design.

Especially useful is this process in railway, ship or gear manufacturing as it enables the repairing of old parts which would otherwise be thrown on the scrap heap, due to the fact that they required an addition of metal for their repair.

The ability of an arc welding outfit to successfully weld cast iron is frequently questioned. It is claimed that the efficiency in strength of the best possible cast iron weld is only 75 per cent. The result is usually a very hard central part, but a very brittle region between it and the surrounding unaffected metal. The change of physical state from cast iron to molten iron is much the same as that of ice changing to water, i. e., there is a fixed temperature of fusion, and the iron does not pass through stages of gradually increasing plasticity, but changes completely. It will be realized then that it would be difficult to control the molten metal, and the brittle result obtained when welding is attempted is no doubt due to molten iron solidifying without sufficiently adhering to the original casting.

Excess current produces porous welds, but if the flux-coated electrodes be used, the flux will have a tendency to reduce this effect as well as giving desirable characteristics to the metal.

Alternating Current Welding

Of recent years, much has been heard of various attempts to apply alternating currents to the process of arc welding and cutting, but the results have not been very satisfactory, the chief reason being the instability of the alternating current arc which at best is limited in length to three sixteenths of an inch.

There are but two points in which the a. c. arc welding equipment can claim to be of any advantage over the d. c. outfit, namely, overall efficiency and lightness of weight in the apparatus. These are more than fully offset by the many disadvantages which the a. c. process possesses. As before mentioned, the arc is very unstable and it therefore

is necessary that a highly skilled operator be employed. Furthermore, an interrupted arc produces a weld which is not homogeneous. Although some work has been done by this process which is comparable with that produced by direct current, yet the work is by no means excellent.

In a previous paragraph, stress was laid upon the fact that the electrode must be of negative polarity in order to obtain the best concentration of the heat. With an alternating current this is impossible and, as a result, the a. c. arc with a given current, will not be as hot or effective as the d. c. arc. This, no doubt, will reduce the margin of efficiency of the a. c. outfit over the d. c. equipment.

The a. c. arc welding equipment simply consists of a small transformer having a large leakage reactance and designed to reduce the voltage to the desired amount. Its effect on the electrical supply system is generally bad. Under load the primary power factor is very low, about 35 per cent., and the frequent interruption of the arc causes an objectionable winking of all lights on the circuit.

The method of operation is very much the same as with the direct current equipment and an outfit of this sort may be found an advantage where the matter of delivery in purchasing or portability in operating will counter-balance the various disadvantages.

Comparisons of Processes

In comparing the processes described as to their commercial desirable and undesirable features, we see that the gas process is preferably for cutting, that the electric resistance process is solely of use for welding and that the electric arc process is very convenient for cutting, but has its chief use in welding on work requiring filling or a higher temperature than we obtain by the electrical resistance method.

With the gas process, the gas tanks must be transported frequently to and from the gas manufacturer, but the flame makes a clean narrow cut unattainable by the electric arc. It does not deposit carbon in the weld, but always necessitates the introduction of a "filler" when welding.

The electric resistance process can be used for thin sheets only, but the equipment is not large and may be conveniently transported.

The electric arc process has many parts to get out of order and requires more skill to operate than the other systems. Initial cost of equipment is high, but the only subsequent costs are for electrodes and for power, and these are comparatively small items. Its main advantageous features are the certainty of good work when carefully handled, and speed and convenience in operation.

Cost

Setting aside the electric resistance and a. c. arc processes, it may be of interest to draw a comparison between the costs of operating oxy-acetylene and direct current electric arc methods.

For thin material, the cost of the processes are approximately equal. As the thickness of the metal increases, there is an increasing margin in the cost in favor of the arc process. The same cost applies to cutting by both processes up to about $1\frac{1}{2}$ in. material. Gradually the cost of gas cutting becomes greater than the arc process until for about 6 in. material, the cost is about 60 per cent. greater than the above. This relation, of course, will vary with the type of work, and also with the skill of the operator, but for approximation the above will suffice.

In welding it is found that at about $1/8$ in. thickness the gas process cost is equal to the cost when the arc process is used. As the thickness of the metal increases the gas process suffers by comparison and from $1/4$ to $1/2$ in. the costs by gas are approximately double than when the arc is used.

Electric Railways

Winnipeg Electric Railway Company Buying New Rolling Stock from Ottawa Car Co.

The Ottawa Car Manufacturing Company Limited have already delivered six car bodies of an order of ten to the Winnipeg Electric Railway Co. The description of these cars is as follows:

Type of Car—Double truck, single end, semi-steel motor car with arch roof.

Seating capacity	46 persons
Weight of car body	19,000 lbs.
Length of car body	33' 3"
Length of front vestibule	5' 0"
Length of rear vestibule	7' 6"
Length over bumpers	45' 8"
Distance between bolsters	21' 6"
Width over all	8' 6"

The bottom frame and sides are of steel with side sill made up of 5-inch x 3-inch x ½-inch angle, rivetted to side plate 18-inch x 5-16-inch; cross members are of 4-inch x 5-16-inch plate, also 4-inch channel at 7.25 lbs., reinforced with oak cross sill; headstock made up of 10-inch x ½-inch steel plate with two 4-inch x 3-inch x ½-inch angles rivetted together.

Bolsters are made up of channels—top 12-inch at 25 lbs., bottom, 10 in. at 20 lbs., with cross channel at centre. Front vestibules, centre and side knees are of 6-inch channels, at

8 lbs. running through to bolster, bumpers 6-inch channel at 13 lbs. with 3-16-inch cover plate for toe board. Rear vestibule centre knees are 6-inch channel, running through to bolster; side knees are of 4-inch channel made up in cantilever style; toe board also of 3-16 inch plate.

Above side plate and below belt rail 16 gauge panels are used between side posts with 1-8-inch strap covering joint. This arrangement facilitates repairs. Belt rail is 2-inch x ½-inch steel strap bolted to post, with beaded bar rivetted to top of side plate with 4-inch x ½-inch reinforcing plate inside.

Body posts are of white ash, straight and grooved for sash. Wood belt rail covered with No. 16 gauge steel.

Front and rear vestibule doors are two leaf folding out and back, controlled by motorman and conductor, with which are operated a folding step, provided with Ottawa Car Mfg. Co. anti-slip tread.

Keystone illuminated sign box is placed in the front vestibule right hand window, also Keystone side window signs are being installed on each rear window. The interior lighting arrangements include five shaded lights in the centre of arch roof, through selector switch on rear platform over conductor's position.

Seats are Hale & Kilburn light weight pressed steel fittings, with Ottawa Car Mfg. Co. spring upholstered cushion

Plan and elevation of double-truck, semi-steel cars for Winnipeg Electric Railway Company.

An unmounted body of one of the new cars built for Winnipeg street-car service

and back, covered with rattan. Motorman's seat is the Electrical Service Supply Co.'s and conductor's seat the Ottawa Car Mfg. Co. standard drop seat.

Heating arrangements are Peter Smith Hot Air Heater No. 2-P. O.

The rear bulkhead has swinging door with door-check arranged to swing in for entrance side, full panelling and sash at centre, sliding door for exit. Front bulkhead has door mounted on double acting spring hinges on right hand side of exit, panelling and two sash with louver in upper half of left hand sash. A protective compartment is installed in rear vestibule for conductor and provided with raised floor about 4-inches high also heater and seat. A winter partition is also arranged for motorman in front vestibule.

Sand box installed in front bulkhead with O. B. sander valve, arranged to sand both rails. Front vestibule windows

proved spring case. Side sash are arranged to lift up with an automatic cam lock. The advantage obtained by the use of lift-up sash is that the absence of lower pockets makes the car more sanitary, because the chance for careless patrons to use the pockets as a place into which to throw or drop rubbish is done away with.

The interiors are finished in cherry inlaid, including doors, sash linings and mouldings.

Rico sanitary hand straps are used over longitudinal seats, total of 21 are installed.

Ventilators are of Brill exhaust, four on each side of roof with grills on inside.

Headlining is of Agasote painted light cream color with railway enamel.

Removable window guards in four sections made interchangeable, are placed on devil strip side. This arrangement makes cleaning of windows easy. Hand brakes are the improved Lindstrom brake.

One special feature of these cars is the coloring of all bronze trimmings to an antique green, a serviceable and lasting color compared with highly polished bronze, which tarnishes after the car has been running two or three weeks.

Painting of these cars is Winnipeg Elec. Ry. standard light cream color above belt rail, below belt rail painted a solid cherry, sash and doors a natural cherry.

Trucks, air brakes and motor equipment are being supplied and installed by the Winnipeg Electric Ry. Co.

The accompanying photographs give a good idea of the general plan and appearance of these cars.

Service-At-Cost a Fair Basis

The Government Commission, which has been investigating the affairs of the New Brunswick Power Company, has made a report suggesting what practically amounts to a service-at-cost basis of agreement. The report sets the cost of the various properties at \$2,800,000, as compared with \$2,200,000 and \$3,670,806 by the city and company estimators, respectively, and recommends that 7 per cent. be allowed on this amount after deducting operating charges. This would enable the company to pay bond and preferred stock dividends and have a small margin for common stock.

The service-at-cost idea is gaining in popularity and may conceivably be the solution of much of the trouble of electric railways and central stations operating under long-time franchises with fixed rates. No plant can give service at less than cost. In the end the public pays dearly for a poor service, cheating themselves under the mistaken notion that they are getting the best of the company.

Interior view of one of Winnipeg's new cars

have double glass with extra storm sash fastened from inside to protect the motorman from frosted windows.

Rear vestibule doors are fitted with electric signal and arranged with switch on door frames, with electric light in front of motorman. The Faraday signal bell system is installed, which provides a dependable and economical means of operating car push buttons, direct from trolley circuit of 500 volts.

Draw bars are provided at each end with Winnipeg Electric Ry. standard draw head with Ottawa Car Mfg. Co. im-

Development of Freight Traffic on Interurban Lines

By A. B. Cole*

The transitory stage through which the electric railway industry is going at present should, if properly guided, result in that the refining process will be for the best. Managements are considering every angle of the operating question with the paramount idea of increasing revenue and reducing expenses to meet the rising costs. The skip-stop, the one-man car, and freight operation all seem to point a way to help keep the balance sheet clear of red figures. While the first two present more or less a purely operating problem, the success of the last is not only dependent on operation, but also business foresight, plainly speaking, salesmanship, in fact all that is embodied in merchandising.

The electric railway has a product to sell as well as any mercantile establishment, and that product or commodity is—transportation. We are speaking particularly of freight transportation, and to successfully market this commodity it is necessary that the electric railway protect itself by the use of a high grade sales or traffic organization.

The problem before the electric railway in marketing this commodity is the same as that of a manufacturer, who must break into the world market with a new product. He analyzes his field, and so must the electric railway in developing freight traffic. After proper analysis, the manufacturer launches an advertising campaign, backed by expert merchandising knowledge of the particular field or fields to be exploited.

The electric railway has the plant, but in too many instances has said "They know we are here, why advertise our freight facilities?" In other words, the key to the situation is that the passenger mirage, which was the dream of the promoters of too many lines, has been permitted to delude business foresight and imagination. Further, this has resulted in the failure to recognize that transportation is a commodity which must be marketed.

Freight transportation, as a commodity to be marketed, must be considered from all angles in order that the electric railway will be most benefitted. Briefly these are:—

- | | |
|----------------------------------|----------------------|
| 1—Law-Making Bodies | 5—The Traffic Bureau |
| 2—The Public at Large | 6—Service |
| 3—The Shippers | 7—Rates |
| 4—The Electric Railway Operators | 8—Facilities |

Usually when speaking of freight, we think immediately of the shipper. However, let us for the moment analyze a few of the other important factors that must be considered in merchandising this valuable undeveloped asset of the electric railway.

Law-Making Bodies

Many lines throughout the country are suffering from unjust restrictions imposed by national, state and municipal authorities. By proper cultivation, and some missionary work, these should be made to see that the electric railway is for the people, and performs an economic duty inseparable from the good and welfare of those served. It seems the paramount duty of all railway operators to be active in Chambers of Commerce, and in fact in as many business organizations as possible, so that the business public will find that the electric railway operator is a real human, and that there is a personality behind his business.

The Public at Large

Make the public think the "electric way" and they all will soon realize that their freight is delivered with despatch, and often at a more convenient point than by other agencies. In other words, advertise your service—not rates. Why has

the motor truck been able to so completely interest the public? Aggressive and effective publicity surrounded the motor truck with a "Veil of Romance," and hitched patriotism and service in the same team, making them almost inseparable. The electric railway needs only to tell its story and keep telling it from the standpoint of service. The electric railway has a reason to exist for it has benefited the life of more communities than any other industry and needs to make no apology for its existence.

The Shippers

These need to be fully informed of the freight service in all of its ramifications, and also told of the service that is backed by proper facilities, handled by an experienced traffic man, who knows how to sell freight transportation.

The Electric Railway Operator

In many instances, it is the attitude of the management to think only of passenger traffic, and permit the freight possibilities to go undeveloped. Thus, in many organizations it will be necessary to arouse interest in "freight service" before any appreciable results may be expected from the people. If the people fully grasped the economic value of the electric railway to them, they would compel their representatives in national, state and municipal governing bodies to enact legislation that would permit the electric railways to serve the people to the fullest extent of their ability and not expect the electric line to comply with many of the unnecessary and burdensome restrictions of interstate commerce rules. There is no more reason for forcing many electric lines to comply with these regulations than there would be to compel all newly established auto truck freight companies to do so.

The Traffic Bureau

The sale of freight transportation can be most effectively accomplished through the institution of an aggressive traffic organization. In turn, this organization must be supported by effective advertising. The traffic that is developed must be properly handled in order to be held. This is only possible through the co-ordination of all freight handling facilities in a community or territory supported by proper co-operation of all railway managements involved in a network or through-routing. It is here that the well-paid traffic manager is a valuable investment, for he must not only look after the development of freight business, but also see that day in and day out there is no break in the service. The freight solicitor proper should be used with considerable discretion. Usually he is of the order-taker type, having only a general knowledge of rates, and knowing little of the elements which make the service. In most cases the results of the experienced traffic manager's personal efforts are so singularly superior, that solicitors are not needed.

Service

The electric railway is in a position to give service superior to that of its competitors, but unfortunately has failed to tell the public in a convincing way about this service. The electric railway excels in time of transit and in the handling of merchandise or despatch freight. While many lines have developed considerable l.c.l. business, the most profitable, the car-load remains undeveloped to any great extent. Were the handling of bulk freight developed, the revenue derived would greatly increase that now received from the l.c.l. freight, which is the most expensive to handle.

Few lines handle sufficient cars in one train to justify

*Westinghouse Electric & Manufacturing Company.

the tonnage at the rate received. Much of the freight handled by the electric lines is of such a character as to take a high class rate and is delivered in small quantities at the minimum supply. In this connection, it is evident that an analysis must be made to determine what classes of freight should be solicited in order to even up the revenue conditions, or to eliminate the tremendous amount of freight minimums. All of this must be sold as "service" and when transportation is marketed on its merits, the rate charged will be secondary with the shipper.

Rates

Generally speaking, electric lines have waited for the steam roads to take the initiative in obtaining increased rates. Considering the principle of rate-making broadly, the electric railways have rarely fought for a special rate based upon the superior service rendered. Proper publicity and constructive work by the traffic departments often would convince the public into paying the higher price that better service deserves. Early morning delivery of overnight shipments and accessibility to stations entitles the electric railway to a differential wherever speed is the essence of the contract. Some utility commissions and chambers of commerce appreciate these inherent reasons for higher rates. Often electric service is worth 25 per cent. more than steam service to the same destination. It is here that sales or traffic methods are required to market the superior product of freight transportation, building up more business and increasing revenue regardless of steam rates. In time, the whole steam rate structure will have to be revised.

Facilities

In order to secure and handle freight business, confidence must be inspired in the shipper. Proper facilities are necessary. Not only rolling stock, both motive power and trailing, must be provided, but terminals and station layouts, according to the character of the business to be handled, including passing and industry tracks at way-stations. In many cases it is necessary for the company to assist in locating grain elevators, coal yards, lumber yards, stock yards and loading chutes, and sometimes these can be located on the railway's property with long term leases.

Two things in the way of facilities that seem to stand out paramount and must be accomplished before an extensive electric railway freight service can be profitably and flexibly instituted in the various states, both for inter-state and intra-state traffic, are the standardization of freight rolling stock, and the pooling of trailing equipment. The pooling system particularly applies to the handling of inter-line trailers, of which there is a drastic need at present.

One of the things which has made possible the extensive development of freight interchange on the steam railways has been the flexible working of the interchange pool which, as you all know, was operated up until government control, on the per diem basis. Therefore, some particular method will have to be adopted by the electric railways in order to more extensively develop interline traffic. This applies especially when the question of long hauls comes up, as for electric railway freight service to be of great value, there must not be any restriction as to destination as long as there is a pair of "electric" rails, reaching to points far and wide. And further, this would be adhering to one of the fundamentals of economical freight operation, which is to keep freight on its original wheels as long as possible.

Sell Transportation Like Merchandise

A careful study of the conditions in various parts of the country reveals the fact that the merchandising of freight service depends upon the same psychological facts, which are fundamental in the advertising and selling of any product.

The lack of merchandising of transportation among electric railways is so evident that authorities in other fields comment on it.

In this connection some very significant points were brought out by the Traffic Service Bureau of Chicago as to why steam railroads should not advertise freight service. Some of the reasons given are as follows:

1. Freight advertising is not necessary because the shippers are pretty wise as to what we have to offer, and we have other means of reaching them with special information.

2. It would involve immense expense, which would be useless if all the roads advertised—for the advertising of one road would offset that of another.

3. Advertising in journals that reach shippers would bring about our ears a swarm of publications soliciting advertising to our great annoyance, and to the end that we would make enemies of those in which we did not advertise.

4. Freight advertising, while it might get for an individual road some business that it otherwise would not get, cannot create freight traffic.

5. While there is no absolute agreement or rule among the railroads against freight advertising, still we are pretty well agreed that it would be a bad policy, and for one of us to start would create an unpleasant competitive situation.

Most of these reasons are unsubstantial and apply only to the new unified operation of the railroads. It would be wasteful for one line of a system to try and attract business from one of its other lines. But it is wrong not to inform the public generally on the matter of the quickest and best route to market its goods and tell them whom to see when in trouble and where he is located, etc. Such matters are appreciated by those who understand the use and value of advertising as a business force. One thing that advertising will do for the electric railway is that there can be shown, through proper methods, that there is a personality behind the freight business.

This personality should be so predominantly brought out in the advertising as to insure the shipper that his interests will be served to the best.

Getting Markets for Farm Products

With the education of the farmer by the Bureau of Markets, pointing out to him the different mediums of advertising through which he can best market his product, this Bureau cites the farm publications as standing alone, being able to perform a most important duty towards the farmer. It is here that the electric railway can do much good for the industry, because the electric railway can run constructive advertising copy calling attention to its published pamphlets, schedules and general information along with articles describing briefly its facilities at hand for serving the various communities affected.

In view of the fact that a large number of the farm papers are more or less localized to certain sections of the country, covering only a few states, it is easily possible to find a medium that will effectively cover a railway's territory thoroughly.

In some cities, the steam railroads go so far as to provide a terminal where farm products are shipped to certain commission brokers who are present daily at these terminals, from which the produce is sold to local dealers or in many cases reconsigned. This same scheme is possible in the electric railway field, where there is any demand for extensive distribution of farm products. The fallacy of the purely farmer's market in many cities has too often proved a failure to require any further comments at this point, other than that attempts to use the electric railway for handling produce to such markets generally have been expensive and in many cases unsatisfactory, unless it is possible to move all goods by carload lots.

Manufacturing industries present great possibilities for development of electric railway freight traffic. These in-

(Continued on page 40)

The Contractor-Dealer

Toronto Contractors Adopt the Open Price Plan—In Future will Exchange Information Freely—Will Raise Status of Profession

The first meeting of the Open Price Committee of the Toronto Electrical Contractors' Association was held in the Board of Trade Building, on March 5. The following members were present: Messrs. McIntyre, Kay, Gray, Hicks, Rohleder, Myers, Ramsden, Drury, Cruise, Salisbury, S. Wood, Groome, B. L. Clark, E. E. Clark, Rooks. Two members only were absent—owing to unavoidable circumstances. The Open Price Plan was thoroughly discussed, but the members present were not quite unanimous as to the advisability of a free exchange of prices. As a consequence it was tentatively decided to go ahead with the plan, omitting the "Exchange of price" feature. Since the meeting, however, the matter has been further discussed. Among others, Mr. Harry Alexander, of New York, a strong advocate of the Open Price Plan, as practised in that city, who was visiting Toronto, gave the benefit of his experiences. The result is that most of the objections have been cleared away and the whole question will be reopened at the next meeting of this committee, when it is thought the original plan will be adopted without change. In the meantime the original motion stands and tenders are being filed in the office of the "Open Price" secretary.

The chairman of the Association, Mr. Kenneth A. McIntyre, is spending a few days in New York and will return primed with information to lay before his committee on the 20th. This meeting is called for 11 a.m. at the Board of Trade and will continue through the luncheon period. All members of the Open Price Committee are expected to be on hand.

Western Men are Again Reminded to Make Their Plans for the Vancouver Meeting

Electrical men in Western Canada are again reminded of the announcement made in our last issue about the big convention to be held in the city of Vancouver, on May 26th and 27th. Mr. W. L. Goodwin and Mr. S. A. Chase will be on the programme, and it is expected that an enthusiasm for co-operation will be aroused among the Western men equal to that displayed by Ontario men during Mr. Goodwin's recent visit to Toronto.

The only thing that can prevent this convention being a big success is the non-attendance of the members. If Mr. Goodwin once gets them comfortably seated before him the rest is, so to speak, merely a "procession." It was so in Toronto. Manufacturers, engineers, central stations, jobbers, contractor-dealers—all came to scoff—but remained to co-operate. It has been so, we understand throughout the cities and States to the south of us, wherever Mr. Goodwin has had an opportunity of explaining his plan.

The West is, of course, handicapped by wider distances and comparatively sparse population, but that does not hinder the success of the Goodwin plan of co-ordination and co-operation. On the contrary, it is an argument in its favor, in that the greater the isolation, the greater, in general,

the need of assistance. Further, Mr. Goodwin's talks in Toronto opened up visions for the industry that few of us had had the hardihood to dream of before. He not only sets the goal, but he tells us how to reach it.

You are again reminded that you will best lend your assistance by writing direct to Capt. W. J. Conway, Secretary B. C. Association of Electrical Contractors and Dealers, at 406 Yorkshire Bldg., Vancouver. Tell him you'll be there and, in the meantime, offer your assistance to organize your district, so that you may be 100 per cent. represented at Vancouver on May 26 and 27.

Mr. Groome Displayed and Explained Benjamin Goods

An interesting feature of the March 6th meeting of the Toronto Electrical Contractors' Association was an address by Mr. Frank T. Groome, sales manager Benjamin Electric Company, assisted by Mr. F. J. Allen, manager of the company, and Mr. Faran, factory superintendent. Mr. Groome had prepared a fine display of Benjamin goods and specialties, and his talk was decidedly educative for the majority of the members. We learn that it is Mr. Groome's idea to visit other contractors' associations from time to time and place before them the salient features of Benjamin goods, illustrating, so far as possible, with actual samples. This plan must have appealed to all the Toronto contractors, as a great time-saver both for themselves and for the company.

We Need a Better Organization for Selling Appliances

The need of the electrical industry at the moment seems to be a better organization for selling electrical appliances. It is felt that the dealer is not saturating his territory or even approximating that condition. This fact largely accounts for the hardware men handling electrical appliances; he realizes the possibilities of development and knows, in a general way, how to bring that development about. It is difficult to believe that this is more than a transitory condition, however. The hardware man has no sympathy with electrical goods beyond the profit they bring him; nor has he any knowledge of the principles underlying their operation which make these appliances so desirable. If the electrical contractor-dealer will only take on the responsibility which seems his, both by training and experience, as well as logically, the business should naturally revert in his direction in a very short time.

One of the features of merchandising which the contractor-dealer has been rather slow to take full advantage of is the splendid "helps" in the way of general publicity, show cards, folders, etc., so frequently supplied by manufacturers and jobbers. He does not realize that nationally advertized goods sell themselves, practically speaking, because the demand has been created by advertising of which he gets the benefit—for almost nothing. Such an instance has just come to our attention. It is a letter sent out by a large Canadian jobbing house, drawing the attention of the contractor-dealer to a list of some fifty electrical specialties

which are being featured in the advertising of this company. The letter points out that this company is advertising these specialties in a special way and that in addition they are being offered at a price which yields a very fair gross profit.

The conclusion seems perfectly plain. An unadvertised article is to-day too expensive to compete with those to which wide general publicity is given. It seems useless then for the dealer to do other than follow the path of least resistance and biggest profits, save himself the trouble and expense of a good percentage of his advertising and, as a result, leave himself more time to concentrate on increasing his turnover. Little by little the various elements in the electrical industry seem to be settling down into their proper groove and performing their proper functions. General advertising is surely the function of the manufacturer and jobber. It is only by fulfilling his own proper function—doubling and trebling—that the contractor-dealer can take his proper share in rounding out the industry.

Hamilton Electrical Contractors Are Going Strong with 28 Members

On March 3rd, at the Royal Connaught Hotel, a meeting of the Hamilton District Electrical Association was held. Ten new applications were received, making a total membership of 28 members. Four members of the Brantford Electric Club were present at the meeting and gave very interesting addresses with reference to the results which have been obtained through co-operation in the Brantford District. At the close of the meeting a hearty vote of thanks was moved to the members of the Brantford Club. Mr. Lyons, the president, replied very fittingly, wishing the officers and members of the Hamilton Association every good wish for their future success.

Arrangements are being made for a large meeting to be held in the Royal Connaught Hotel, on March 19th. Invitations are being sent to every electrical man in the Hamilton district to attend this meeting. Mr. Frank Groome, sales manager of the Benjamin Electric Mfg. Co., is going to address the members on the products of the House of Benjamin. Mr. K. A. McIntyre, chairman of the Ontario Association of Electrical Contractors and Dealers, will attend the meeting and address the members on association matters.

The convention of the Lighting Fixture Dealers' Society of America in Pittsburgh on Feb. 10 and 11 was responsible for bringing two new trade associations into existence. Among those attending the convention were representatives of leading fixture manufacturers and manufacturers of illuminating glassware. These two interests organized associations of their own while in Pittsburgh—the National Council of Lighting Fixture Manufacturers and the Illuminating Glass Manufacturers' Association.

Shade Holders—Folder by the Harvey Hubbell Company of Canada, Limited, illustrating and describing Hubbell Shade Holders for standard and Mogul sockets. These holders are designed to grip the socket more securely than the ordinary holder and to hold securely regardless of jarring, vibration or weight of shade.

Mr. Lorne C. Webster has been appointed president of the Quebec Railway, Light, Heat & Power Company, in succession to the late Sir R. Forget. Senator D. O. Lesperance, of Quebec, is the new vice-president.

How I Increased My Sales 100%

One of the most perplexing problems, which confronted the Nation in 1917, was the fuel problem. What could be done to conserve fuel and yet save time and money? This is best told by the result of concerted effort and the practical application of our new thought "Save by Wire" and in presenting it to the public.

The immediate necessity of selling electric heating appliances, etc., was quite apparent, and the resolve made that a heating device campaign should be put on as soon as competent men, appliances, etc., could be obtained. This was all arranged in four weeks, and by August 5th the campaign started, featuring the electric flat iron, toaster stove and percolator. The first week's sale resulted in over 500 sales, and by the time the fourth week was finished, we had piled up the magnificent total of 2,306 pieces sold. This did not include any sales made by the regular staff in the salesroom, but only bonafide orders taken by the campaign crew. The articles were all sold at list price, and totalled more than \$16,000.00 with a total connected load of approximately 1,500 hp., and with the sales made in the office by the regular force, the total amount was \$19,633.00, or 1,520 hp.

The especially pleasing feature of the campaign was the fact that the number of telephone orders received in response to our advertising appeals was so pronounced, neighbors complaining that their friends did not order one for them, and if it was not too late, would we send one at once to them, etc., which was always cheerfully done. The daily sales averaged over 100 pieces for the 21 working days, the number in the campaign crew was ten. The devices were sold on the basis of \$1.00 down and a \$1.00 a month, which appealed to more than 80 per cent. Fifty per cent made the initial payment with the order, on the others first payment was C. O. D. It required extra help to make the deliveries, but in trying out two girls with the regular driver of a Ford delivery truck, good progress was made and few cancellations were made. No fuss was made when anyone wished to cancel an order; it was cheerfully done, and by this method, we found that may reordered what they had cancelled. The campaign instead of leaving things quiet as is usually the case after a Christmas rush, has given the heating appliance business a tremendous boost, and the daily sales are far better than they were before the campaign was put on. Our customers are glad of the opportunity they have had, and the practical use that can be made of these appliances. Altogether we feel that we have accomplished a great deal in a city of approximately 56,000 people, and the people feel that we have given them an opportunity and they appreciate it. The easy payment plan is the only way to put on a campaign of this kind and make a success of it, and to those who are not afraid of the vast amount of extra work it entails to those actively engaged in the sales and accounting department, we would recommend such a campaign, but it means that you must co-operate with the campaign crew, and give the necessary impetus to such a movement. Newspaper advertising was featured throughout the campaign and the total pieces sold given in large type. Telephone orders were received thus "Send me one of those 721 toasters" which was the first number announcing that 721 housewives of our city had taken advantage of the special easy payment plan and had helped "Save by Wire."

A by-law will be voted on, on April 5th, in York Township, authorizing expenditure of \$200,000 to provide Hydro-electric service for the township, including purchase of present distributing equipment owned by the Ontario Hydro Commission.

Developments in Electrical Merchandising

By W. L. Goodwin*

Now a word about intensive development of present fields. The opportunities are unlimited. But it is too big a job for one concern. We must all work together to get real results. We must expand the industry in undeveloped fields. Not more than fifteen per cent of the population of the United States enjoy the benefits of electricity, and not more than twenty per cent of the homes are wired. Are we going to be satisfied to see such a small percentage of the population of this country enjoying the benefits of electricity? It is your job to give these benefits to humanity. Why should you not go out into the hills of New Hampshire and Vermont and see to it that the little farmer there enjoys the benefits of electricity. Why should only we of the big cities enjoy convenience and economy in electricity? Out in California we wired the farms. The development temporarily netted a loss. The central stations clubbed in and ran a line out so that these farmers could develop their country. The people in the cities paid the loss in carrying electricity to the farmer. Most of us, however, are so busy chasing the almighty dollar that unless we can get a dollar and a half for every dollar we put in, we don't move. We ought to appropriate five million dollars to develop the industry. We think nothing of giving the Red Cross and a lot of other organizations money. Why not give five millions dollars to develop this industry so the Society for Electrical Development won't have to get down on its hands and knees and beg for two hundred thousand dollars a year to advertise the industry. The Wrigley Chewing Gum Company spent \$1,400,000 last year advertising chewing gum and we can't get \$500,000 a year out of the whole industry.

The efficiency of the electrical organization is about 21 per cent. We spend most of our time patting the other fellow on the back. The competitive pace, and the unfairness of competition with which we have to contend doesn't permit of very much human efficiency. You can determine efficiency of the workman, but if you paid the heads of the business on the measure of their efficiency, they wouldn't get sixty cents a day. Who can take Mr. Smith and measure his efficiency? We just camouflage our jobs, and I know because I have done it myself. We have got to get the brains of this business to work to develop its efficiency.

You can't develop a plan locally. And you can't do anything national until the men get together locally, and you can't get men together locally as long as each fellow prefers to stay in his own backyard and hold on to all his little advantages. I attended a convention in Cleveland recently, and there wasn't a single thing said about what was going to be done the next year. Let us get together and talk about things that we are going to do next year and the year after. Most of our conventions have been gatherings of a lot of men who constitute themselves a mutual admiration society. We have got to turn up some real constructive ideas and put them to work.

Merchandising Methods Must Be Improved

There should be improvement in merchandising methods, better display, and the encouragement of more retailers, by urging present contractors to open retail stores, thereby enlisting the support of central stations and offering a broader and larger outlet for manufacturers. Our present neglect in this respect is almost criminal. The various groups should know where they stand and the lines that each handle. You

make money when you sell goods, but the electrical industry thinks it makes money when it buys goods. We have the highest selling expenses of any industry in the country. As middlemen, our function is to get the product to the consumer. If you want to buy phonographs or pianos you go to a certain man who sells that particular article. But in our business, you don't know where to go. Our competitive system of doing business is at fault. Our salesmen are out of the cheapest kind. The average salesman in the electrical business is mighty glad if he can make \$150 to \$175 a month. Anyone can go out and sell cheap clothes and make \$5,000 a year. The salesmen in the electrical business have no chance to develop their ability. The system is all wrong. Brains play a very small part in our selling policy. Instead of the salesman going out and doing real creative work he goes out on highly competitive work. On the Coast I employed salesmen to go out and show contractors how to sell goods to the next man. When I held an annual convention I brought all the contractors from around the country to attend my sales meeting and paid their expenses because they were a part of my sales organization and sold my goods in the local communities.

When a woman buys an electric iron for six dollars she wants a life guarantee on it. But if she buys an automobile for \$2,100 she expects to scrap it in three years. The central station tells her to bring her iron back if it doesn't work right and they will fix it up for her, and will probably give her about nineteen dollars worth of repairs on a six dollar iron. We haven't educated the public, as the automobile industry has, to scrap our appliances after a certain length of time. Our customers expect our goods to last forever.

My plan recommends the sale of high-grade electrical material; the establishment of high-class specialty retail shops. It is almost pitiful to go round the country and see the places called electrical shops. You have some beautiful stores in Worcester; Springfield has two or three. In Boston the ones I saw were shameful. There is no present inducement for a man to put a lot of money into a store. There is no encouragement for a man to go into the electrical business, and that is why we have no good stores. We must do everything possible that will encourage electrical distribution. The more points of contact we make with the public the more we relieve the central station of its burden.

Service and Compensation

My plan recommends recognition of the service functions of the contractor-dealer, and recommends a price differential when this service is performed. Under present conditions there is an everlasting battle between the jobbers and contractors. I am not trying to precipitate a trade row, but it is up to the jobbers and contractors to get together and settle a lot of things.

Quality Production

One of my planks recommends the sale of high-grade electrical material; the establishment of high-class specialty retail shops; improved specifications in wiring installations; and the introduction of liberal use of convenience receptacles. I think that any electrical man that knowingly buys a poor grade of material and misrepresents it to the public ought to be cast out of the trade. I recently saw some Japanese Christmas lamps that were mislabeled as to voltage. That should not be permitted. The best we can get is none too good and we always ought to try to elevate the standard instead of buying cheap stuff. I have seen snap switches that you could actually crush in your hand. If you want that kind of junk, keep after the manufacturer for it and he will soon supply you with sockets that you can sell for a cent and a half apiece. The only thing that has kept the standards up (no credit to the four divisions of the industry) is

* From Address before Massachusetts Contractor-Dealers.

an outside institution, our guardian angel—the Board of Underwriters.

Buy the best you can, don't fall for a cheap line of junk. There are toasters now that sell for ninety cents. Think of it! One fellow starts cutting prices and then you keep after manufacturer until he gets something out that is a disgrace to the industry. Every year the automobile manufacturers make something better but you try to get the electric manufacturer to make something cheaper.

Education of the Public

Another plank recommends broader education of the public with respect to the problems of the electrical industry, and with further respect to electricity, its uses in the field of household operations. When you buy a phonograph, watch or any other article of merchandise, you will find some instructions for the use of it. But do we even go out and tell the public about our articles? We leave them in ignorance. Naturally something happens the woman thinks she is being imposed upon and sometimes she is. We must take the public into our confidence and tell them all the ramifications of the electrical business in simple language which can be readily understood. In that way only shall we ever secure the public's confidence. We have got to tell the public about our industry, and remove the shroud of mystery that now envelops it.

Intensive Sales

Another of my planks recommends retailers applying intensive sales methods in connection with small devices used in home, factory office, etc. (such as washing machines, vacuum cleaners, dishwater electric ranges, electric heaters, household heating devices, sewing machine motors, fans, lamps, portables, fixtures, vibrators, hair dryers, ice machines, etc.). This plank needs no explanation.

Live and Help Live—The Basis of Peace

By S. A. Chace*

I do not believe that the merchandising end of the electrical industry as a whole has done sufficient serious thinking; if it had we wouldn't now be in the absurd position of not having a definite plan to propose whereby all classes of the industry would understand exactly what their respective functions are and confine their efforts and regulate their business and create sales policies accordingly. In other words, the industry has no definite, universal plan of merchandising.

The average salesman in the electrical industry has not been a serious thinker; on the contrary his principal endeavors have been to get customers, hold customers, get more customers and sell goods at a profit, and let someone else do the heavy thinking; but I believe the experienced salesman can come nearer telling us the real route to true merchandising than anyone else on the pay roll.

The experienced jobbing salesman knows the value of the contractor-dealer to the jobber, to the central station, and to the customer as a retail distributor, and the manufacturer's salesman of experience also appreciates the values of the jobber as a wholesale distributor.

But, gentlemen, I am wondering: Is the electrical industry educated up to that point where it is ready for a definite plan of merchandising?

Are there not in the industry at the present time still some manufacturers who consider the jobber and the contractor-dealer unnecessary evils and who prefer to "sell direct and save the middleman's profit?"

Are there not some amongst the contractors and dealers who prefer to eliminate entirely the jobber and endeavor to purchase direct, although the jobber has endeavored to cooperate? And so they lock horns over the trifling percentage and upset trade conditions, greatly to their own loss.

Are there not jobbers also, who, when selling at retail and often to the contractor's customers, totally disregard the service rendered by the contractor?

Are there not also manufacturers and contracting engineers who look upon the consulting engineer as an inter-loper and endeavor to destroy his usefulness and profit in the business by preparing plans and specifications for which they make no charge?

Old-Fashioned Way

Are there not some so-called manufacturer's salesmen who are of the class who usually keep their desks locked because they fear their associate salesmen will secure information, and who in a narrow old-fashioned way, endeavor to sell everything direct, eliminating everyone else but themselves, and who have not as yet learned the true lesson of merchandising, of selling through the legitimate and natural channels of distribution?

Just as long as the experienced salesman is obliged to sell true merchandising to his employer, whether he be a manufacturer or a jobber, just so long is an educational plan necessary.

If there are also still amongst us central stations with a policy so blind to the necessities of the public, to their own profit, to others in the industry, and to adequate distribution as to retail electrical supplies without regard to the cost of merchandising and without considering the services rendered by the contractor, proper educational methods are still necessary.

If there are still amongst us men of influence and authority in any of these various classes so blind to the light of true merchandising as to clog the wheels of progress of the industry as a whole, I fear we are not yet ready for a definite plan, because they would not accept or follow a plan which would safeguard the best interests of all classes in the industry, and considerable educational work is still necessary.

I do not want to convey the impression that progress has not been made towards true merchandising, because I feel that wonderful educational progress has been made, especially during the last two years, but what I do wish to emphasize is that if there are still in the industry men of importance and influence responsible for sales policies, who, through lack of experience or false conceptions of the proper merchandising methods for the distribution of electrical supplies or who have not yet learned the true gospel of live and help live, then, gentlemen, there is still a necessity for much educational work in which we should all participate before the attitude of mind is ready for a definite plan and a just peace to properly protect all classes in the industry.

Progress in Two Years

I referred just now to the fact that wonderful progress has been made, especially during the last two years. The reason why I said this was because it was about two years ago when I first heard Mr. Goodwin state his views in a speech before your National Association at New Orleans, and he has awakened the entire industry as it was never awakened before. For the first time in the business life of many of us, we are seriously considering the merchandising problems of all classes in the industry. Before that many of us, including myself, were drifting along—manufacturers, central stations, jobbers, contractor-dealers and salesmen alike, in a self-satisfied way, disregarding business ethics, the rights of others and our own best interests (if we only knew it) in a mad rush for business.

The interest, enthusiasm and results already obtained

*Before Massachusetts Electrical Contractor-Dealers.

through Mr. Goodwin's efforts have aroused all branches of the industry, so that for the first time all classes in the industry are asking each other "What sales policy or plan shall I adopt?" and if in your opinion the entire industry is sufficiently educated to appreciate and follow true merchandising methods is it not, gentlemen, therefore, for us to formulate a definite plan?

It is just as necessary for us in the electrical business to have a definite and just plan as it is for all nations in order for them to have a universal and just peace.

Plan for Price Differentiation

Following the inspiration of Mr. Goodwin and realizing the necessity for a definite plan Mr. J. J. Gibson of our company, has prepared a plan of "Price Differentiation on the basis of Quantity and Service" which, in my opinion, is the only fair and just method which will properly safeguard the best interests of all and justly recompense each transaction according to the service rendered. This plan has been submitted to all classes in the industry, and criticisms and suggestions have been requested—in other words the plan has been put up to shoot at, in the hope that through the suggestions and criticisms offered the plan will be made perfect.

The manufacturer, the central station, the jobber, the contractor-dealer and the consulting engineer should each prepare a plan of merchandising which, in the opinion of each, is the right plan from his standpoint, and then submit it to the others for consideration. It may be that each will have to give up a little to the others in order to make the plan a just one—for unless a plan is just and safeguards the interests of all it will not last, and of necessity must have the support of all in the industry.

It is only necessary to attend such meetings as these to fully appreciate this wonderful wave of enthusiasm which has spread over the entire industry. Jobbers, manufacturers, central stations, contractors, consulting engineers, as well as the electrical press, are all interested as never before, and all are apparently in the proper attitude of mind to preach the gospel of "Live and Help Live." It seems as if we are on the verge of accomplishing something wonderful but lack something to enable us to hit the target and make a bull's-eye. Perhaps each class in the industry is too selfish, too indifferent and too cold, and lacks the proper amount of affection for others in the industry. Perhaps we are all too suspicious. Perhaps the difficulty lies in the fact, as I have pointed out before, that we have no definite plan of merchandising which covers the distribution of the products of a manufacturer to the ultimate consumer, and that such a plan of economical and efficient merchandising, safeguarding the interests of all, is all that is now necessary to produce perfect harmony and stability throughout the entire industry.

The lack of serious thinking in the past is not confined to the merchandising end of the industry alone, but to all departments and in all branches and amongst all classes of the industry. In the mad rush to put electrical goods on the market sufficient serious thinking and consideration of all the various problems affecting the supply, demand, and sale have not been given.

Take for instance the sale of household appliances. Did you ever stop to consider and realize that not one kitchen or dining-room out of ten thousand is properly wired and equipped to enable the house-wife to easily and safely use the electric coffee percolator, the electric toaster, or the electric iron?

Few Homes Properly Wired

The average kitchen has but one electric light fixture with one lamp, and it is necessary to take this lamp out of the socket in order to connect up the iron; the average dining-room has four lights over the dining-room table, and in order to use the percolator or toaster it is necessary to dis-

turb these lights and suspend cords, which are unsightly, and take time and trouble to connect. And I will venture to state that many of you and your friends have, therefore, abandoned the daily use of these appliances and they are now used principally as ornaments on the dining-room sideboard.

Has any manufacturer of heating appliances devised for the contractor a standard and inexpensive device within the reach of the average salaried man—one which will pass the fire underwriters, which, when installed, would enable the housewife to easily use household devices? No! But they will all urge you to sell the appliances, and yet the way has not been shown so the various devices can be easily and safely used. If some standard method and device is devised and sold through the contractor, the result would be an enormous increase in the sale of the appliances and a big increase in profitable wiring for the contractor.

The contractors in many localities have not been alive to the opportunities presented, or there would be established retail stores in shopping and residential districts enabling the consumer to purchase electrical appliances, lamps and other supplies easily. Now that many central stations are desirous of having incandescent lamps sold through the contractor-dealer, the lack of proper stores and proper distribution is a serious handicap to this movement.

But as I have stated before, wonderful progress has been made, especially during the last few years, and if we keep up this gait great achievements will be obtained and proper and efficient merchandising methods will be devised which will safeguard the interests of all in the grand orchestra of the industry.

What the National Association Stands For

The Ontario Association of Electrical Contractor-Dealers is in affiliation with the National Association of Contractors and Dealers of the United States and, as affiliates, the members of the Ontario organization, as well as the contractor-dealers throughout Canada, will be interested in knowing more about the functions and activities of the United States association. These are clearly outlined in a recent issue of Contact by Mr. W. H. Morton, general manager of the National association and we reproduce in part below:

The National Association of Electrical Contractors and Dealers now includes all retailers of electrical merchandise, regardless of their business, and the association is now on a broader and better basis than ever before as it now binds the state, district and local associations more closely together as a whole for the highest possible standard of co-operation.

The electrical industry needs immediate plans for procuring statistics and data in order to map out a proper procedure for bringing about the desired movements. And these problems need the study of all branches of the business if we would have ultimate success. The industry must first be placed on an economic and efficient basis by providing the time necessary to collect statistics and data needed for an intelligent study of its problems.

Second—From the information collected determine a policy that will be fair to all, a policy which provides for proper compensation to all who render any service of value.

Third—To provide funds for proper publicity mediums in placing said policy before the entire industry.

Fourth—That the first three can only be accomplished by the real co-operation of all branches of the electrical industry working toward the distribution of all forms of elec-

trical material from the manufacturer to the consumer in the most economic and efficient way.

There is no progressive industry today without its trade organization, and the strength and activity of such associations are the standards by which an industry can be judged.

Facts About the Association

The formation and method of operation of the National Association is given below in the forms of questions and answers.

Why Has This Association Been Formed? To promote the greatest possible co-operation between manufacturers, jobbers, contractors, central stations and all retailers of electrical materials, enhance the welfare of its members and to aid the maximum development of the Electrical Industry.

Who Is Eligible to Membership? Any person, firm or corporation engaged in the business of electrical contracting or repairing, or who installs electrical apparatus or sells electrical supplies at retail, this being the principal part of their business.

Who Is Eligible to Associate Membership? Any person, firm or corporation who installs electrical material or who retails electrical merchandise, such forming a minor part of their total business.

Is a Manufacturer Eligible? Yes, if he sells any goods at retail; that is direct to the consumer, such as motors, vacuum cleaners or other electrical goods, which are the product of his factory.

Is the Jobber Eligible? Yes, if he sells goods at retail.

Is the Central Station Eligible? Yes, if it sells electrical merchandise to its consumers and the general public.

Can the Hardware or Department Store Become a Member? Yes, if such store sells electrical supplies at retail.

Is a Fixture Manufacturer or Dealer Included? Yes, provided such firm sells goods to the public at retail.

Is the Motor Repair Shop Eligible? Yes, the business of dynamo and motor repairs, rentals and sale of new and second-hand machines are all essential parts of the retail sales in the electrical industry.

What Is the First Thing a Firm Does to Become a Member? Makes application to the District Secretary. If the District is not yet organized, apply to the State Secretary. If your State is one of the few yet unorganized, or if you do not know the name of the District of State Secretary, apply to the National Association of Electrical Contractors and Dealers.

What Is the Organization Plan of the Association? The country is divided into four "Divisions", Atlantic, Central, Pacific and Canadian, consisting of the States or Provinces in each of these geographical sections. Each state or province has its own State Association and the various cities or groups of towns form District Associations.

Dues Are Equitable

What Does It Cost to Become a Member? Initiation fee \$10.00 and dues of from \$5.00 per year up, according to the annual volume of business, for the National Association, plus the rate of dues of State and District Associations. It is necessary to become a member of the District and State Associations in order to join the National Association.

Are the Dues for Associate Members the Same as for Members? Yes, and said dues are calculated on the gross sales in the retail electrical department of their business.

What is the Universal Data and Sales Book? A loose-leaf book with leather cover, published at an original expense of over \$4,000 and kept up to date by new sheets being mailed constantly. It contains the latest list prices and documents, with manufacturers' name, description of articles, catalogue number, date of issue, for nearly every article sold, including list prices on rubber covered wire from 13 cents to 45 cents bases, inclusive. This book also contains elec-

trical engineering and contracting data, wiring symbols, wiring tables, illuminating data, reprint of National Electrical Code, etc., and a complete list of members of the National Association, listed by States.

Is the Universal Data and Sales Book and Renewal Sheets Furnished Free? Yes; one copy to each member and associate member without charge, and additional copies at cost price.

What Has the Jobber to Gain by Membership? He will meet his contractor and retailer customers, assist in developing them as electrical merchants, and will immediately benefit by the increased sale of his own goods to these contractors and retail customer, who will be better credit risks, and a far greater volume of business will be obtained for all through this systematized co-operative effort.

How Will the Hardware or Department Store Benefit? Associating with the jobbers and retailers at business meetings will teach them the particular needs and problems of electrical retailing, resulting in wiser sales policies, greater volume of business and better satisfied customers.

Will the Central Station Benefit by This Membership? They certainly will. It is the greatest opportunity ever offered them to assist in a scientifically organized plan to develop their own business; a plan on a sound business foundation, which will create harmony in all branches of electrical endeavor, making new friends and boosters for the central station in every territory.

In What Way Will the Fixture Dealers, Motor Repair Shop and Others Benefit? Organized effort will discourage ruinous competition and create new customers within the association. Intelligent discussion of sales methods and cost accounting will mean dollars gained and dollars saved.

Where Do the Benefits to the Contractor-Dealer Come in? Most important is the value of meeting and working with (not against) your competitors. Membership in the District, State and National Associations provides this great opportunity.

Information of inestimable value is sent out from the National Headquarters very frequently.

Liability and automobile insurance for members is provided and has resulted in 25 to 40 per cent being returned on annual premiums.

Uniform Proposal Sheets and Universal Estimate Sheets are furnished that prevent errors and omission in contracting work.

A splendid bookkeeping system for contractors and retailers is furnished to members at nominal cost.

Plans for the Future

The National Code Committee will act for any member desiring to appeal from an inspector's decision, and the other committees are acting at all times in their interests.

Our industry is now in a state of evolution. The most serious problems in its history confront us. If the business of the electrical contractor and dealer is to be preserved and made a factor in the commerce of the country, we must prepare to form a constructive part in the councils which are determining our status in this important period following peace.

Many of the rulings which have been made by the War Industries Board will form a basis of future practice. Far-reaching changes in the manufacture of the materials we use and their installation are contemplated. Our advice is sought and expected in the solution of problems which will vitally affect the future of our business, and such advice can only be given through a National organization.

If you ask "What do I get out of it?" we say, "a liberal return on the small amount you put in" as organized effort, properly supported by those in the industry, will eliminate waste and duplication of effort.

Beating the Pirate

By Sidney Neu

There is never a gathering of contractors and dealers without a defamatory discussion of "the pirate." Certainly, prices should be maintained, wiring jobs should be figured with ample allowance for overhead and profit, but it can't be done—"the pirate" gets the business.

The pirate, according to the Standard Dictionary of electrical terms, is a third rate wireman, calling himself an electrical contractor, having an office located in his head-gear, who buys some of his materials second hand and steals the rest, considers the Underwriters' rules as a thing to be avoided, if possible, and evaded where necessary, skins the job to the bone and hasn't even sense enough to make a profit out of the extras, and whose shoestrings are just sufficient to keep him two jumps ahead of the sheriff—for awhile. Should this delectable individual really cause worry to a legitimate business man? Is he so strong that the legitimate contractor must descend to his level to stay in business?

Although it is not generally known, there are or have been "pirates" in every line of business. When John Wanamaker started in business there were hundreds of peddlers peddling in Philadelphia. Did John follow their tactics, selling his wares for as much as he could get? He did not; yet John Wanamaker grew and the peddler quit. We still see occasionally itinerant vendors of collar buttons, shoelaces and suspenders, yet the legitimate haberdasher can afford to pay his rent. The legitimate clothier is prosperous in spite of the bargain sales of the department stores.

There are obvious reasons why these legitimate stores survive their pirates. They have something to offer which the public values that the pirate cannot give, and they im-

press this on the public continuously by advertising. Their advertising creates so much business that there is plenty for them after the pirate has snooped off his little chip.

The legitimate electrical contractor-dealer, if he is really "legitimate," has something to offer that "the pirate" cannot give:

1. He gives honest merchandise and materials, the best obtainable, which is a point of extreme importance in electrical work which remains installed for years without attention.

2. He has a store where the customer can pick out the fixtures to suit himself and not be disappointed by getting what he paid a cheap price for.

3. He can give sound advice as to the number of lights and outlets needed in every room.

4. He knows where to place his outlets to give the user the greatest possible convenience so that the job does not have to be done over.

5. He follows conscientiously the safety rules of the Underwriter, giving a generous protection against fire.

6. He carries an ample stock of materials so that the job is never delayed.

7. He employs careful workmen who do not damage flooring, woodwork, or anything else.

8. He guarantees his work and his materials, and his guarantee is worth something.

He has a place of business where he can be reached in case anything goes wrong or additional work is required.

The main reason the public patronizes "the pirate" is because the public does not realize these things. The public will never know unless the public is told, and the cheapest way to tell the public is through advertising.

All Electrical Men in Western Canada

Manufacturers, Jobbers, Dealers, Central Station Men,
Contractors, and all interested in the Electrical Industry

TAKE PRELIMINARY NOTICE

that under the auspices of
the B.C. Association of Electrical Contractors and Dealers

A Gigantic Electrical Convention

will be held in the CITY OF VANCOUVER on

MAY 26th and 27th Next.

The Chief Speakers will be

W. L. GOODWIN and **SAMUEL A. CHACE**
Author of the Goodwin Plan

Every electrical man in the Western Provinces is urged to take a hand in this monster Electrical Gathering. Wives are specially invited.

In order to get on the mailing list drop a card to the Secretary, 406 Yorkshire Building, Vancouver B.C. Then "Boost" for 100 per cent. representation from your own district.

Coin-Operated Automatic Photographing Machine Which Completes a Picture in Sixty Seconds

A coin-operated automatic photographing machine which has a magazine capable of holding one hundred sensitized plates at one filling is being marketed by the Wm. Gent Vending Machine Company, Cleveland. The whole operation is under electrical control, and a completed picture is produced in sixty seconds. When a silver dime is dropped in the slot an electric circuit is completed which starts a motor. Then a metal plug is forced in between the two coin springs, which takes up the circuit, allowing the coin to drop in the cash box. Next, the plate is ejected from the under side of the magazine and dropped down behind the lens and a long cam forces the plate against a flange so as to secure accurate

alignment and distance. Another cam then throws in the arc lamp switch which is immediately followed by a cam which opens the shutter momentarily (the shutter opening can be set to take care of fluctuation in voltage). After exposure the plate is dropped into a lead pan and the one solution developer and fixer is squirted on it, filling the plate to the rim as the plate is lying face up. All this is done in ten seconds. In another forty seconds the plate is acted on by chemicals, washed and then ejected through a large slot in the front of the machine, from which it is taken and placed on an electric dryer. The motor of the machine is provided with a friction governor which is set for the particular voltage on the line on which it operates. All the action described is entirely automatic. This machine produces a perfect photograph in one minute, for one dime.

Oil Testing Cup

The only known satisfactory method of determining the insulating value of oil is to measure its dielectric strength by means of a spark gap immersed in the oil. Various devices requiring a comparatively large sample of oil and a rather high voltage for their successful operation, have been used for this purpose. Consequently there has existed a distinct demand for a device that would give reliable indications with a minimum sample of oil and with a relatively low testing voltage. A device for this purpose has been developed by the Westinghouse Electric & Mfg. Co., and is shown in Fig. 1. This new design uses a moulded construction, so that the cup proper is all in one piece, and therefore,

is simple, rugged and compact. Fig. 2 shows this cup with electrodes removed and dismantled. The moulded part contains two brass electrode bushings threaded to receive the packing gland. Back of each packing gland is a small amount of cotton packing, such as waste, which prevents oil leakage around the electrodes. The bearing surfaces are reamed to receive the electrodes, which it is claimed guar-

Fig. 1—Oil testing cup assembled

antees perfect fit and exact alignment. The electrodes are made from a cylinder one inch in diameter, threaded at one end to receive the lock-nut. Binding posts are placed on the outside end of the electrode to attach the leads from the testing transformer. A steel feeler gauge for setting the gap at exactly 0.10 of an inch, is attached to one of the binding posts, when not in use. The device has a cup shaped interior to contain the oil substance to be tested, and the construction allows thorough cleaning without disturbing the gap setting. The feeler gauge is concealed within a hole in one electrode. It is claimed that the whole testing cup is light, compact, and convenient. It weighs only 6½ pounds net, with dimensions of 8½ inches by 4 inches by 4¾ inches,

Fig. 2—Oil testing cup showing parts

and requires only a four ounce sample of oil. The maximum voltage required for reliable testing is 25,000 volts. Higher voltages may be used if available, but it is seldom that higher than 30,000 volts will be required to discharge across the standard gap (0.10 of an inch) through any insulating oil.

In spite of the strenuous opposition of the Montreal Light, Heat & Power Company, the Private Bills Committee of the Quebec Legislative Assembly has given power to the city of Verdun to levy a tax up to two per cent. of the value of the poles, wires and other equipment of the public utility companies using the streets of the city.

A Commutator Resurfacer

For many years it was taken for granted that when a commutator started to spit and spark and showed evidence that it was in need of being dressed up, the only thing to do was to shut down that equipment, remove the commutator and turn it down on a lathe, or temporarily tide over the trouble by using sandpaper. If any thought was given to the labor this required and the loss of production by taking so much power out of service, we figured it was merely part of the day's work or a necessary evil. Experiments to determine a short cut finally brought forth a non-conducting composition which, when molded and hardened, presented a continuous abrasive surface that by simple contact with the commutator while in motion, would cut down the mica, ridges and bars—easily and quickly. Every conceivable test was made and the high expectations were justified in all instances by results obtained. This device is known as the Ideal Commutator Resurfacer. The resurfacer is not limited in its application to commutators, but may be used equally as well on a.c. collector rings. The same appliance does the work on one just as readily as on the other. The Ideal Resurfacer is manufactured and supplied by the Ideal Commutator Dresser Co., 4 So. Dearborn St., Chicago.

Fuse Sizes for Industrial Motors

The proper size of fuse for a motor is only too often obtained by the chief electrician or one of his repairmen by haphazard methods. The motor's normal operating current is given by the maker on the name-plate, but fuses are properly selected of a larger capacity to allow for starting and for momentary overloads. Hence it is rather more usual for the maintenance man to select his fuses "be guess and be gosh," with a view to their permanence in service rather than the safety of the motor they are supposed to protect.

In order to give a practical working idea of what sizes to use, the Westinghouse Electric & Mfg. Company has prepared the accompanying tables. These are based on the following assumptions as to size of fuse required to stand starting current without blowing:

Type	Times Fuse Load Current at Starting
Polyphase Wound Rotor	1½
Squirrel Cage (thrown on line)	3
Single-Phase Repulsion Induction with Rheostat	2
Single-Phase Repulsion Induction without Rheostat	4
Direct Current	1½

Since the fuses for squirrel-cage and repulsion motors without rheostats are, respectively, rated at 3 and 4 times full-load current, they give practically no overload protection. Hence it is recommended that double-throw switches be installed, connecting the motor through fuses of 1.25 times full-load rating (as under Wound Rotor sizes) for running and through the regular heavier fuses or direct to the line for starting.

3-Phase Squirrel Cage Motors

Well-known Figure Passes

The electrical industry in Canada has suffered a distinct loss in the death of Mr. James Johnston, chief electrician, Department of Public Works, Ottawa. Death took place suddenly at his late residence, 16 Arlington Avenue, Ottawa, on Sunday, February 21. Mr. Johnston was first associated with the Edison General Electric Company and later with the Royal Electric Company of Montreal. In 1886 he installed the first electric light plant to furnish light to the Senate Chamber, House of Parliament, Ottawa, and continued for 33 years in the service of his country. All the electrical installations in Dominion Government buildings, from Victoria to Halifax, have been designed by Mr. Johnston, some of which are among the largest undertakings of their kind in Canada. Mr. Johnston leaves a widow and three daughters, all residing in Ottawa, and one son, Mr. J. A. Johnston, manager Public Utilities Commission, Brockville, Ont.

Mr. Keeling Sales Manager for Canada.

From special representative for the Province of Ontario to sales manager for Canada, is the record made in eight months by Charles H. Keeling, who has just been promoted to the latter position by the "Square D" Company. In

Mr. Chas. H. Keeling

the sales contest, inaugurated by this company last year, for the greatest increase in percentage of sales over a fixed quota, Mr. Keeling won the grand prize—a magnificent grandfather's clock. Mr. Keeling is now preparing for a sales trip to the Pacific Coast.

Mr. McCallum Joins "Square D" Company

After years of experience in the electrical field, William R. McCallum has joined the selling forces of the "Square D" Company, of Walkerville, Ontario. He will work this company's Province of Ontario territory. Mr. McCallum

Mr. Wm. R. McCallum

was in the electrical contracting business, in Ottawa, for several years. During this time he completed some of the largest electrical installations in that city, as well as a number of government contracts throughout Canada.

Obituary

Mr. George H. Olney, managing director of Eugene F. Phillips Electrical Works, Ltd., Montreal, died at his residence, Linton Apartments, Montreal, on March 2, aged 50 years. He had been in ill-health for a long time, suffering from hardening of the arteries, and about two years ago retired from the position, on the advice of his medical adviser, still retaining his seat on the directorate. A few weeks ago he resumed his duties as managing director. Mr. Olney had been connected with the company for twenty years, the success of the firm being largely due to his activity. He was a very hard worker, with a grasp on the many details of the various departments. Mr. Olney went to Montreal from Providence, R.I. The funeral service was held in Montreal on March 4, and was attended by representatives of the various cable companies and other electrical industries. After the service the body was conveyed to Providence. Mr. Olney is survived by his widow and a son and daughter. His son, Lieut. H. Olney, lately returned from active service in the Royal Air Force.

The Bell Telephone Co. has just occupied their new exchange at Collingwood, Ont. The common battery system has been installed.

Development of Freight Traffic on Inter-urban Lines

(Continued from Page 30)

dustries are located many times in centers of distribution so that carload shipments of products can be easily handled by the use of trailers to points on the electric line. This also holds good for large wholesale and distributing companies, for example, such as chain stores. In this case the main warehouse for a chain of stores may be located at some central point where the electric railway can handle all traffic to the various stores in the chain. This presents a continuous flow of traffic which insures the electric railway a profitable return, as most of this freight moves in large quantities, sometimes carloads.

Relation of Motor Truck and Electric Railway

Some of the more or less sane motor truck operators feel that the function of the truck is to act as a feeder to existing transportation systems, and especially to the electric railway, due to its rapid transit. Possibly, the ultimate solution of this problem lies in the regulation of the motor truck by the several states and in the use of the electric railway and the motor truck in one or all of three ways:—

One—The use of the motor truck as a direct feeder for l.c.l. freight to the electric railways.

Two—Through a system of containers let the motor truck operators be forwarding agents to the electric railway for freight collected from certain distribution centers to be shipped via the electric railway, similar to forwarding agents at seaboard.

Three—The motor truck in shuttle service between electric railway systems that are separated and requiring a link for a through freight route.

The foregoing remarks have been made with the intention of pointing out a few fundamentals that will have to be considered in developing freight traffic. While the question of facilities has hardly been touched there still remains much to be said on this subject, but the greatest action that is necessary in developing freight traffic is the provision for organizations for developing this traffic, backed by proper merchandising methods and aggressive salesmanship, based on public psychology.

Current News and Notes

Cobalt, Ont.

The Nipissing Central Electric Railway, connecting Cobalt, North Cobalt, Haileybury and New Liskeard, concluded the year 1918 with a deficit of \$8,000 on the year's operations. Members of the board of directors are seeking to secure a fare increase of approximately 25 per cent.

Fredericton, N. B.

The receipts of the New Brunswick Power Company for the year ended December 31, 1918, amounted to \$774,251.85, but owing to the fact that the operating expenses amounted to \$612,002.49, as compared with \$424,893.65 the previous year, there was only \$69,159.94 net earnings to add to the surplus account.

Galt, Ont.

The financial report of the Galt Hydro-electric system for the year 1918 is the most satisfactory in the history of the department. The total revenue from all sources amounted to \$108,536. Total expenditures, including interest on debentures, sinking fund payments and depreciation, amounted to \$95,514, leaving a net surplus of \$12,822.

Guelph, Ont.

Plans and specifications are being prepared, and tenders will be called, for two electric pumping units having a joint capacity of 3,024,000 imperial gallons for twenty-four hours, and a booster pump for fire purposes, for the city of Guelph. It is the intention of the city to install this equipment at the earliest possible opportunity.

Hamilton, Ont.

At the annual meeting of the subsidiary companies of the Dominion Power and Transmission Company, Hamilton, it was stated that there was a deficit last year of \$535,000 on the Hamilton Electric Radial Railway, which runs from Hamilton to Oakville.

London, Ont.

It has been announced by the London & Port Stanley Railway that, commencing May 1, all employees will be given an eight-hour day and wages will be increased to a certain number of motormen and conductors.

Montreal, Que.

Booth Brothers, electricians, Montreal, Que., have dissolved partnership—Clarence D. Booth continuing.

It is reported that the Montreal Light, Heat and Power Consolidated contemplate a further reduction in lighting rates in the near future.

Gross earnings of the Southern Canada Power Company for January were \$53,221, against \$42,866 in January a year ago, an increase of \$10,355. Operating expenses at \$26,652 showed an increase of \$3855, leaving net earnings of \$26,569, an increase of \$6478.

Ottawa, Ont.

The financial report of the Ottawa Hydro-electric System, just submitted, shows gross earnings of \$263,410—an increase of about \$9,000 over 1917. Total expenses amounted to \$221,178—an increase of about \$18,000 over 1917—leaving a gross surplus of \$42,232, and a net surplus, after deduction depreciation charges, of \$5,400.

The Dominion Railway Board have rendered a decision against allowing the application of the Ottawa Electric Railway Company for authority to increase its rates on the Britannia and Rockcliffe lines. The board holds that the company has been and is prosperous and well managed, and that the efficient management has resulted in large dividend earnings as well as a proper service. The decision is that

the company has failed to show that it requires increased revenues. The board hopes and expects that costs will shortly decrease.

Port Arthur, Ont.

The finance committee of the city of Port Arthur has recommended that a by-law for the issuing and selling of debentures for \$80,000 for the construction and improvements to the electric railway be passed, and that another by-law covering the issue of debentures for \$20,000 for telephone work be also passed.

The Ontario Railway and Municipal Board recently met in Port Arthur to listen to a protest of representatives of the Trades and Labor Councils of Port Arthur and Fort William against the increase in street railway fares. The Board, however decided that the increase was quite in order and that they could take no action in the matter.

Regina, Sask.

Passenger receipts of the Regina street railway system for February show approximately an increase of \$4,000 over the same month last year.

St. Thomas, Ont.

A citizens' committee appointed some weeks ago to devise means of placing the street railway system of St. Thomas under better and more economical management, has reported advising the adoption of one-man cars and a complete change of routing. A saving of \$12,000 a year is estimated as the result of these changes.

Toronto, Ont.

It has been announced, although not officially, that work will shortly commence on the Toronto-London Hydro Radial Railway.

Windsor, Ont.

The Canadian Renulife Electric Company, Limited, has been formed to deal in the manufacture and sale of medical electrical appliances. The head office of the company will be at Windsor and the capital stock is given as \$40,000.

Wingham, Ont.

Delegations from Teeswater, Wroxeter, Lucknow, Brussels, Belgrave and Blyth, Ont., recently attended a meeting called by the town council of Wingham, Ont., to discuss plans for securing Hydro extensions into these municipalities. A committee was appointed to wait on the Hydro-electric Power Commission and it is expected to secure immediate action.

York Township, Ont.

A Hydro by-law will be submitted on April 15 to the electors in York Township, providing for the expenditure of \$200,000 to be used in buying out the existing lighting facilities in the township.

Mr. A. H. Foster, for the past eight years manager of the Guelph Radial Railway System, has been appointed manager of the Brantford Radial Railway.

W. C. Crawford, a prominent Chatham business man, and president of the Windsor, Essex and Lake Shore Electric Railway, died recently after a short illness.

The lines of the Detroit United Railways are to be taken over by the city, the price agreed upon being \$31,500,000.

Lighting Fixtures—An attractive booklet by **W. H. Banfield and Sons**, Toronto, illustrating and describing the lighting fixtures manufactured by this company.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

Induction Motors Wanted

One each 15, 25, 35, 50 H.P., 550 volt, 60 cycle, 2 phase. Would consider other voltages or three phase. State full particulars and best cash price. Address Box 843, Electrical News, Toronto, Ont. 3-t.f.

For Sale

1-150 H.P. Corliss Steam Engine, made by Cowan & Co., Galt, Ont. Girder frame, left hand drive, side crank, 13' x 26" fly wheel.

Will sell at a bargain.

Full particulars on application to

Hydro Electric Commission,

5-t.f. of St. Thomas, Ont.

Equipment For Sale

We have for sale the following second-hand electrical machinery in good condition, with accessories.

4 Grinder motors, 450 H.P., 250 R.P.M., starting electrical resistance, drum controller.

6 Water cooled transformers, 375 K.W., 12,000 volt primary, 440 volt secondary.

1 Paper machine motor, 125 H.P., 500 R.P.M., 440 volt.

1 Installation high tension cable.

1 Paper machine motor, 100 H.P., 500 R.P.M., 440 volt.

1 Incoming line panel, switches, transformers, etc.

1 12,000 volt aluminum cell lightning transformer.

Delivered F.O.B. Cars, Thorold, Ont.

Address: Natural Resource Corporation,

538 Gluck Building,

Niagara Falls, New York

5-6

EQUIPMENT FOR SALE

Three only 250 K.V.A. single-phase, 25 cycle, oil-cooled station transformers, mounted on trucks, wound 2,200 volts primary to 550 bolts secondary, and arranged for standard hydro taps, Moloney make; 2,500 feet 1,000,000 C.M. triple braid, weatherproof, Waco, stranded copper cable. H. Mueller Manufacturing Co., Ltd., Sarnia, Ont. 6

150 H.P. MOTOR FOR SALE

Immediate delivery, new, never used, 3 phase, 25 cycle, 550 volts, 500 R.P.M., with extended base, pedestal bearing, 34 inch pulley, slide rails, also with Cutler-Hammer drum type starter with resistance. Address—Hydro-Electric Power Commission of Ontario, 190 University Ave., Toronto. 6

Generator Set Wanted

Wanted to purchase 1-500 K.W. Motor Generator Set or rotary with the following:—A.C. End, 2200 volt, 3 phase, 60 cycle. D.C. End, 250 volt, 2 wire. An alternative of 2-250 K.W. Machine would be considered. Machine to be complete with the necessary starting device, switches and switchboard rheostat and usual instruments.

Effect of War on 1918 Central-Station Business

An interesting sidelight on the effect of the war on central-station business in 1918 is given by Alex. Dow, president of the Detroit Edison Company, in his annual report. He said in part:

Our sales of power to the smaller factories showed less than the average increase. On the other hand, our sales of power to the larger factories and particularly to those which promptly undertook war work, increased beyond the average for the year. Residence lighting, which is an important part of our business (175,967 residences were served in December and \$3,188,512.65 earned by that service in the twelve months), likewise showed more than the year's average increase. This is due to an increase in the number of residences connected, and not to a commensurate increase in use by the average residence customer, who in 1918 was likewise asked by the

government to practice economy of light and fuel.

The increase in sales of power to large factories was the result in a measure of their working night shifts and of overtime and Sunday work. The stoppage of overtime, etc., by government instructions after the signing of the armistice coincided with the removal of the Fuel Administration's restrictions on display lighting, so that there was no net resultant effect upon our December earnings, although the effect of each official order is clearly recognizable in the daily load curves.

Path Followed by Rupture in Steel Fusion Welds

From investigations made by S. W. Miller, the first evidence of strain in electric welds appears where visible defects may exist in the weld, such as film of oxide around the grains or around small particles of metal. Therefore, every effort should be made to avoid the formation of oxides. If there are no defects in the weld, the rupture is invariably along the grain boundaries. These conclusions apply to welds as made and not to those that have been heat-treated. Also, the path of rupture due to shock or alternating stress may possibly be different from that due to tensile stress. Since all brittle welds resemble each other in having more or less columnar structures and containing such impurities as pearlite, cementite and nitride of iron, it is possible that quenching may help remedy the trouble since it produces an entirely different structure.—Electrical World.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

The P. L. Robertson Mfg. Co., Limited

MILTON, ONTARIO

One of the drivers supplied FREE

A Perfect Connection in One Fifth of the Time

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL

The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"

Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"

Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"

Fire-resisting paint, or colorless solution.

"ARMACELL"

Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"

Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"

for coloring electric lamps. Used in the Royal Navy. Weather-proof. Dries rapidly.

"ARMABRON"

Bitumen protective paint, elastic, acid-resisting, weatherproof.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of
every seeker of mercantile credit. Its busi-
ness may be defined as of the merchants, by
the merchants, for the merchants. In pro-
curing, verifying and promulgating infor-
mation no effort is spared, and no reasonable
expense considered too great, that the results
may justify its claim as an authority on all
matters affecting commercial affairs and mer-
cantile credit. Its offices and connections
have been steadily extended, and it furnishes
information concerning mercantile persons
throughout the civilized world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing con-
cerns, and by responsible and worthy finan-
cial, fiduciary and business corporations.
Specific terms may be obtained by address-
ing the company at any of its offices. Cor-
respondence invited.

THE BRADSTREET COMPANY

If a Brush Absolutely Refuses to Spark!

is that not a very good reason for fitting it on your motor generators and commutators?

No-Spark Carbon Brushes

wear longer because they are frictionless and self-lubricating. The remarkable economy of these brushes will appeal to you. They have often outlasted the ordinary brushes 8 to 12 times over.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:

"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

DOSSERT & CO., 242 West 41st St., NEW YORK

H. B. LOGAN, PRESIDENT

Irving Smith, Canadian Rep., 602 New Birks Bldg., Montreal.

Here is Your Opportunity Denzar Dealers—

DENZAR is the proper unit for correctly lighting offices and factories as well as stores, schools, halls, lobbies, etc.

It gives a diffused light of day quality on the working plane, without glare or distracting shadow. In many cases where DENZAR has replaced other types of lighting units, efficiency has been increased 15 per cent. and more. The superior features of DENZAR are easily recognized.

New buildings are going up—reconstruction is taking place—offices, factories and stores are replacing their old lighting fixtures with new and more efficient units—schools are providing better lighting facilities for students—there is a big demand for proper lighting fixtures—DENZAR.

Are you getting your share of the business? Are you taking advantage of the sales-making co-operation we are offering our dealers? Let us suggest a means for increasing your DENZAR business.

NOTICE

To Manufacturers and Others

We are not only builders of the famous Lincoln Arc Welder, but we are also in a position to quote you on welding and repairs to your machinery or boilers. We have complete equipment for this work and can have our plant brought to the job on short notice.

We keep a staff of operators ready for any emergency.

Let us quote you on your welding and save many dollars on machines that you would otherwise scrap. A phone call will bring a man in a hurry.

You can save 50 per cent.—very often more—by doing your boiler plate work with a Lincoln Arc Welder instead of rivetting it.

Lincoln-welded joints are 100 per cent. strong—rivetted joints are no stronger than the rivets themselves.

It has been adopted by boiler shops, structural steel works, street car and railroad companies as being the most practical solution of the present labor shortage.

Electrical Safety

Thousands of power companies and all types of users of electricity throughout North America protect millions of circuits with

ECONOMY renewable FUSES

ECONOMY FUSES are accurately rated—that means safety. They can be used over and over—that means economy. It takes but a moment to replace the link and renew the fuse—that means convenience.

An inexpensive "Drop Out" Renewal Link restores a blown economy Fuse to its original efficiency.

The ECONOMY is a *pioneer* renewable fuse—the first to be proved practical. It is widely imitated but not duplicated.

Order by brand, from your electrical jobber or dealer.

Free Samples If You Write Today

A. F. DAUM, Sole Mfr., Pittsburgh, Pa.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

Drew Overhead Material

This feed-in Screw Clamp Trolley Ear is made from bronze with horizontal feeder lug to accommodate 0000 size feeder wire. This ear can be furnished tinned if so desired.

This Screw Clamp Trolley Ear is supplied both in malleable where the ears are galvanized by the hot dip process or in bronze. It can accommodate grooved or Figure Eight to 000 size.

This Samson Splicing Ear is installed without special tools, stays upright in the span, cannot make a hard spot in the line and is non-arcng. Repeated service records show that the Samson will outwear the wire in which it is installed under the most severe operating conditions.

This Samson Tunnel approach is for taking trolley into barns, under bridges, elevations or through tunnels where there is a minimum clearance. It is good practice to place the insulated hangers about six feet apart. The tapered "V" shaped lips of the Samson Approach give smooth under-run.

This hanger has a galvanized Clevis with $\frac{3}{8} \times 1\frac{1}{2}$ in. machine bolt, and is for use in connection with the Samson Tunnel Approach shown above.

This hanger is used when the trolley is supported in shallow wooden trough or like places such as mines or structures with low rods. Its height has been reduced to a minimum.

All Drew materials are guaranteed to be free from defects in material and workmanship, and to do the work for which they are designed in a thoroughly satisfactory manner.

Our nearest house will supply you with descriptive literature on request.

Lightning Flashes
may instantly burn
out your apparatus
if not protected
with—

Garton-Daniels Lightning Arresters

In nearly every station, on nearly all lines, you find the Garton-Daniels—the one type of lightning arrester that has remained unchanged in principle through more than a quarter century of service.

Think of it! For over 25 years they have been protecting many millions of dollars' worth of electrical apparatus.

And they have been doing it right, because their small air-gap distance, low series resistance and positive mechanical circuit breaker form a combination which is the most efficient and reliable lightning protective unit known.

And right now, before lightning flashes actually interrupt your service and probably burn out some apparatus, it is indeed the time to consider lightning protection and buy sufficient Garton-Daniels Lightning Arresters to protect all of your apparatus.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 580 describes this instrument.

Edison Mazda Tungsten Lamps

In Buying Light

"Get Your Money's Worth"

What Your Lamp-Dollars Buy

You may not be interested in buying Lamps, but you are interested in the best Lighting in your Home, Office and Factory.

There are three things which your Lamp-Dollars buy: 1, Durability; 2, Candle Power; 3, Life.

How often have you bought Tungsten Lamps at what you thought was a bargain, only to find that when opening up your parcel, two or three were broken and two or three others would not light. "Was that economy?" You will agree it was not, but it was the natural consequence of buying cheap foreign made Lamps.

Your Lamp problem resolves itself into the problem of getting the greatest Durability, Candle Power, and Life, per dollar of investment. No matter where you buy your lamps—no matter what price you pay—bear this fact in mind.

Go to a dealer whom you know, and let him tell you the merits of Edison Mazda Lamps. Buy a lamp that is made by a Canadian firm which you know, and which has a reputation to sustain. See that the manufacturer's name or trade-mark is plainly stamped upon them.

THE EDISON MAZDA BOOKLET, "EDISON MAZDA MEANS ELECTRIC LIGHT FOR EVERYBODY," can be secured from your dealer or is sent gladly upon request to any address in Canada. It will help you to a clearer understanding of how to make sure of getting the best value for every dollar you spend. See your dealer or write our nearest branch office.

Last year this Company paid out in wages over five million dollars. This large sum paid to Canadian work-people was spent in our own country and thereby every class of the community was benefited to a greater or lesser extent. It costs no more, and often much less to buy Canadian made goods, and in that manner keep Canadian money circulating in our own country instead of sending it abroad for the benefit of labor in a foreign country.

For every dollar you spend on Edison Mazda Lamps you get "The Most 'Durable Lamp' and the greatest amount of Light for the least amount of Electricity."

Universal Insulator Supports

SAVE
Time, Labor and Material

UNIVERSAL INSULATOR SUPPORTS are specially designed malleable iron clamps made in four sizes for securing insulators to open steel framework for wiring mills, foundries, shops, bridges, piers, elevated railways, subways, train sheds—and similar structures. They are easily attached, and by their use, electric wiring for lights, motors, generators, cranes, etc., can be installed with a great saving of labor and material.

Reasons for R&M Fan Reliability

Reason Three— The Speed Coil

The speed regulating coil of the R&M induction type fan is thoroughly insulated and heavily taped. It is provided with a laminated steel core.

The coil, switch and terminals are mounted on a moulded insulation base which has great mechanical strength and high dielectric properties.

The switch is so constructed that pressure on the lever cannot effect the contact. It moves over a deeply notched metal strip which insures positive "off" and "speed" positions.

Strong, substantial construction and quality workmanship are apparent in every feature of this important part of the R&M Fan.

No 7

Daily Press Not Fair to Public Utilities

No. 1 of "Public Service Topics," an interesting little sheet published by the Toronto Railway Company, has just come to hand. In initiating this course, the local company is following a precedent already established in a large number of cities on this continent.

There can be little doubt that the Toronto Railway Company are taking the right course and that the educational possibilities of such a publication, if widely distributed among the patrons of the company, must be very considerable. On the other hand, one cannot but deplore the necessity for it. Surely the facts regarding one of our biggest public utilities should be freely placed before the public by our local press, who are the natural medium through which such information flows. The attitude of the press towards privately-owned public utilities, however, is well known and the Toronto Railway Company has come in possibly for even a little more than its fair share of condemnation and vituperation. It is the easiest thing in the world to arouse public opinion against capital in any form and the Toronto daily press, during the past few years, have deliberately and systematically sought to create and intensify this feeling of animosity. No attempt has been made to place both sides of the transportation problem before their readers, but on the contrary, the press has been careful to say only such things as they felt the public wanted to read. They have followed, not moulded, public

opinion and, to this extent, have degraded the function for which the press exists.

No further evidence of the truth of this statement is required than the fact that private corporations all over the continent have found it necessary to present their own side of the case through special publications similar to that of the Toronto Railway Company, mentioned above.

No one, however far removed he may be from the capitalist class, can deny that the cost of operating a street railway system has increased very considerably during the past four years. Is it common sense reasoning then to suppose that any railway system can sell service at the same rate as formerly? It is greatly to be hoped the general public will prove more fair-minded than the press, that they will read this "Public Service Topics" and give some thought to the situation. The transportation problem in Toronto is not at all a personal matter. It is a matter of getting better service than we are getting at present—for which the public, without question, is ready to pay a fair price.

Electric Combine—£5,000,000 Scheme to Command the World's Market

There has just been put into practical operation a scheme for the consolidation of a number of important electric and engineering undertakings. For the purpose of the scheme there has been formed the English Electric Company, with a capital of £5,000,000 in 1,500,000 £1 Preference and 3,500,000 £1 shares, of which about £2,000,000 has been issued, chiefly Ordinary shares.

This new concern has exchanged its shares for those of Dick, Kerr & Co., formerly represented in Canada, the Phoenix Dynamo Company and the Coventry Ordnance Company. The centre of the organization is Dick, Kerr and Co., which controls the United Electric Co. and Willans and Robinson, Ltd. Furthermore, it has a close alliance with Siemens Brothers, Limited, through an exchange of directors.

As to the policy of consolidation and expansion, the object is to assist the development of the business of the allied concerns in the provisions of all classes of electrical machinery, and especially large sized steam turbine generating plant.

Companies have been established in France and Japan to exploit the manufacturing rights of the group and local capital has been raised. The recent acquisition of the Coventry Ordnance Co. brought the group into relationship with John Brown and Co., and Sir Charles Ellis, managing director of John Brown and Co., will become chairman of the new company.

"Electrify-Your-Home" Movement

At a meeting held on March 12th, 1919, in the offices of The Society for Electrical Development it was the prevailing opinion of the attending representatives from the individual branches of the industry that a house-wiring campaign was needed and would be timely. The scope of the campaign includes the wiring of houses now built but un-wired, the wiring of houses that are contemplated or under construction, also a drive for the wiring of industrial and commercial buildings.

There were present at the meeting representatives of the central stations, contractors and dealers, jobbers, manufacturers—including fixtures, lamps, appliances and apparatus—the trade press and members of the Society's staff. It was brought out at the meeting that many central stations are carrying on house-wiring campaigns at this time. It was shown that it would be better to inaugurate the campaign at this time rather than to wait until the Fall or later, because such a stimulus is needed and desired by the industry generally. It was also the opinion that no better time could be se-

lected for approaching the average house-owner prospect than right now. The statement also was made by manufacturer representatives that they did not believe there would be further reductions in material prices and that there was an uncertainty of labor wages decreasing. It was felt, on the contrary, that labor costs would be greater, thereby offsetting any possible reduction in material prices. Another important point brought out was that home owners and builders must be shown that they will not gain materially by withholding decision to wire or build their houses, and this will be a feature of the campaign. The campaign slogan "Electrify Your Home" was decided upon because of its greater scope; it appeals to house-wiring prospects and also to those for appliances and apparatus.

Six weeks was definitely set as the period for the campaign, the time being from April 1st to May 15th. The Society plans to have the material for the campaign in the hands of the industry before April 1st. House-wiring orders for the most part do not come into the store or shop unsolicited—the average house-wiring prospect **must be sold**. And the forthcoming campaign is built around this fact. The selling and advertising helps for use in the campaign comprehend every reasonable requirement. One feature is the portfolio which the Society will distribute and which will contain descriptions of all the sales and advertising helps, as well as explaining the what, why, when and where of the campaign—the "how to's" in other words. This elaborate portfolio will be sent free by the Society, upon request. The campaign materials include all necessary advertising illustrations, printed matter, slides and complete window trims. As in previous national campaigns, the majority of the material will be supplied free to members of the Society, and to non-members at cost prices.

The window trim, consisting of three pieces, i.e., one cut-out, one poster, and one streamer, will be printed in three colors. The lamp companies' representative agreed to purchase and distribute window trims, to their agencies. The representatives of the electrical press agreed to aid in every way possible in putting over the campaign. Representatives of the national electrical organizations and associations also are being depended upon to put their whole support and effort behind the campaign.

Government Power House at Lake Edward

The Public Works Department propose to construct a power house and laundry in connection with the Military Hospital Building at Lake Edward, P. Q. It will consist of a basement and one storey, with concrete foundations. The basement will contain coal bunkers in the rear, engine and dynamo and pump rooms and workshop at the right hand side, the central portion being used for the laundry. The dynamo room is to be separated from the pump room by a 9-in. brick wall, and the laundry will be cut off from the other sections by 14-in. brick walls. The first floor will contain another portion of the laundry, including the disinfection room, with stores and toilets. A high brick chimney is also to be erected, having a cast iron cap. The foundation, walls and beams, including the chimney foundation, are to be of concrete. The boilers are to be carried on girders supported by concrete piers.

The floors of the boiler room, bunkers, engine and dynamo room and pump house will be of 4½-in. concrete, with a wearing coat of 1½ inches thick. The floor and laundry roof over the bunkers will be of reinforced concrete. The main roof is to be covered with asbestos shingles, and the roof of the other portion with tar and gravel.

The power plant will consist of a 20 kw. 125 v., d.c. generator multipolar type, direct connected to a steam engine. The panel board is to be of the double branch type. The

system of wiring will be designed for the parallel two wire 110 v., d.c. interior conduit system.

Electricity in the Glass Bottle Industry

Mr. G. Percy Cole, technical engineer of the Dominion Glass Co., spoke on "Electricity in the Glass Bottle Industry" at the Montreal Electrical Luncheon on March 12th. This subject does not look promising for the introduction of any humour, but Mr. Cole managed to amuse as well as to convey a large amount of interesting information. He was formerly in the electrical business, and speaking of the difficulties encountered, remarked upon the task of explaining the meaning of power factor to a "bunch of aldermen." But, he added, he did not know what trouble was until he got into the glass industry. He then by means of samples and a number of slides, described the process of making bottles by machinery and hand. The plants of his companies were electrically operated, using a large number of motors, mostly of the a.c. type, although it was necessary to use variable speed machines and direct current. Mr. Cole then enumerated the various motors which were installed, adding that storage batteries were also used to some extent, and with good results. The motors were used to operate unloading machinery, conveyors, crushers, gas producer plant, annealing ovens, fans, blowers, etc. For the glass industry it was not necessary to use motors of over 100 h.p. Experiments had been made with a view to using electricity for heating the annealing ovens, and he believed that they would obtain successful results. Experiments had also been carried out for melting the materials by electricity, but there were some serious difficulties to be overcome and he would not venture to prophesy success in this direction, enabling glass manufacturers to dispense with gas producer plants. So far no electric furnaces had been constructed which met with their requirements.

Electricity in Steel Rolling

The Electric Club of Toronto had a fine address on Friday March 21st, from Mr. E. S. Jefferies, chief electrical engineer of the Steel Company of Canada, who motored over from Hamilton, bringing Mr. Culley, Mr. Stalford and a number of other electrical men from that city with him. Mr. Jefferies described the electrical equipment of his company's blooming mill, particularly with reference to the large reversing motor which is capable of attaining full speed, from rest, in about a second and a half. It appears that electric drive in the operation of rolling billets into long beams is just about twice as efficient as steam drive—another triumph for electricity. In our next issue we hope to give Mr. Jefferies' address in full. It is safe to say that few lecturers have proven more interesting to the club. Mr. Kenneth J. Dunstan, the president, occupied the chair. Mr. P. A. Borden, as usual, very kindly assisted with the projections.

Small Hotel Plant

A small plant for supplying the Hotel Dieu, St. Basile, Madawaska County, N. B., is being installed, from plans by Mr. J. A. Roy, Montreal. A steam boiler is already installed in the hospital and a 20 h.p. engine is being set up to drive a 15 kw. generator. The supply of water is to be drawn from a stream 4,000 ft. from the site of the hospital, and situated on the other side of a hill 150 feet above the water level. The power from the steam plant will be transmitted to a motor in a small power house near the stream. The water which will drive a DeLaval pump, will be pumped into a reservoir from which point it will be carried by gravity. The plant is also being used for lighting the hospital.

Electric Power from Swift Rapids Plant

A Combination Generating Plant and Ship Lift Lock—Current Supplied to Town of Orillia

The town of Orillia has been in the forefront of electrical development since the early days of the industry. During the 90's the town had a steam-driven lighting plant, used for arc lighting and incandescent service. This plant had been installed with what was then thought ample capacity, but it quickly became overloaded and about 1899 a proposal was made to utilize a water-power on the Severn River some 20 miles from the town. There were two possible power sites, one at the Big Chute and the other at Ragged Rapids. The head at Big Chute is 58 feet and at Ragged Rapids 47 feet. The latter site was decided upon and a concrete pier and stop-log dam built. For some reason the dam was located in the middle of the rapids instead of at the foot and a head of only 33 feet was developed.

A contract was awarded in 1899 to P. H. Patriarch for \$65,000, this contract including the dam, powerhouse, machinery and transmission line to Orillia. The installation consisted of two single 40-inch water wheels with cylinder

not been taken to bed rock in the centre, but were built on cemented boulders which seemed to be solid rock. No damage was done other than the loss of the head. Steps were immediately taken by the town to restore the dam and after some months a rock filled crib dam was built above the broken dam, including that portion of it in which were located the head gates and waterwheel penstocks.

This dam was in operation from 1903 to 1908. During the low water period in the summer, the leakage through this dam was so great that there was not enough to keep the plant in operation and so third dam was built, this one of reinforced concrete, a few feet down stream from the original dam, but still including the penstock and headgate portion of the original dam. This section was known as the gravity section to distinguish it from the new section which was hollow. Through the bottom of this section were placed five 60 inch Venturi sluice pipes of cast iron. There was also a pier and stoplog spillway with openings totalling 70

gates and two 300 kv.a., S.K.C., two phase, 1,200 volt inductor alternators. The cylinder gates were later changed to wicket gates. After considerable difficulties, mostly owing to absence of railway transportation nearer than sixteen miles at Severn Bridge on the G. T. R., the plant was placed in operation in 1901.

Three Dams Built

After operating with more or less success for about two years, the dam failed by undermining and a large portion of the middle piers fell into the river. The dam foundations had

feet by 9 feet. With this dam the head available was 41 feet maximum.

In 1906 an extension was built to the power house to house a third unit, which consisted of a 1,200 h.p. 40 in. double runner Sampson waterwheel, direct coupled to a Westinghouse 600 kv.a. 1,200 volt, two phase revolving field generator, separate exciter and four 150 kv.a., 1,200 to 2,200 volt transformers. This increased the installation to a total of 1,200 kv.a.

The transmission line was a single circuit wood pole

line 19 miles in length; the poles were cedar, 30 ft. long and 8 inches diameter at the top, spaced at 104 ft. and carrying one two-pin crossarm and a ridge pin giving a 28 inch triangle. The conductors were No. 4 h.d. bare copper. A No. 10 iron wire telephone circuit transposed every 5 poles was also provided five feet below the high tension. The high tension conductors were not at that time transposed so that the telephone was always noisy.

Temporary Tie Line

Mr. Greenwood, shortly after his appointment as engineer in 1910, prepared a report on the power plant and, after investi-

Fig. 2—Plan of power house, showing location of turbines, generators and transforming equipment

gation, recommended the construction of a new power house building and equipment to be located some 700 feet below the dam. Construction of this plant was actually under way when the Department of Railways and Canals intimated that the Severn division of the Trent Canal was to be proceeded with and that the town had better await developments and work was, therefore, stopped.

In order to tide over this period a contract with the Simcoe Railway and Power Company was entered into for a supply of power from the Big Chute plant. A tie line was

Fig. 3—Power house section—Exciter, turbine and generator shown

accordingly built from the Big Chute to the Ragged Rapids, some 9 miles in length. This line was built in a 66 foot right-of-way over very rough country, mostly granite rock ridges and swamps. The poles were 30 ft., 7 in. top cedar at 120 ft. spacing, carrying two 2-pin arms, 4 feet apart, with pin spacing of 48 inches. Three No. 2 aluminium seven strand conductors were used on Ohio Brass Company 27,000 volt, 2-piece

insulators. A 5-16 inch seven strand galvanized steel ground wire was strung on the tops of the poles to protect them from lightning. A No. 10 copper, h.d. telephone circuit was also strung. At the same time, 1911, a second transmission line was built from Ragged Rapids to Orillia. The same construction was used except that No. 2/0 aluminium was used for conductors. Telephone was transposed every five poles. The high tension conductors were also transposed three times between Big Chute and Ragged Rapids and nine times between Ragged Rapids and Orillia.

New Plant in Connection With Canal Development

When the plans for the Trent Valley Canal were finally adopted it was proposed in order to avoid heavy expense in rock cutting, etc., to pass the Ragged Rapids dam, to wipe out the Ragged Rapids dam and power house and to build a new dam and lock some two miles further down stream at Swift Rapids and to incorporate in the work a new power-house.

This plan was agreed to by the town of Orillia and a contract was awarded by the Department of Railways and

Fig. 4—Construction view of spillway, Swift Rapids dam

Canals to the Inland Construction Company for Section 2 of the canal work, which included the Swift Rapids dam, lock and power house, and lockmaster's house.

Fig. 1 shows the general plan of the work with the dam, penstocks, powerhouse and lock.

Fig. 2 is a general arrangement of the powerhouse, showing wheel setting, generators and transformer compartments on the main floor.

Fig. 3 shows a cross section of the powerhouse and penstocks.

Fig. 5 shows an elevation and cross section of the dam.

Owing to war conditions, the lock is still unfinished. This will be a single lock of 48 feet lift. It will be provided with one pair of mitring gates on the breast wall and a vertically operated steel gate on the lower end. This gate will be raised by operating machinery placed on a steel bridge which will be supported by reinforced concrete towers. The necessary height to give clearance to vessels means

Fig. 5—Horizontal and cross section of spillway—Note Venturi sluices and inspection tunnel

that these towers will have an imposing appearance. The architectural features have not been overlooked.

Three Venturi sluices are built into the bottom of the dam, and for the purpose of unwatering them at any time stoplog checks are formed in both ends of the four piers protecting the ends of the sluices.

Small Boats Carried on Railway

To avoid locking small boats an electrically driven marine railway will be installed on the dam. It will be operated by a 20 h.p., 550 volt, 3 phase, 60 cycle motor. The estimated length of the railway track is 680 feet and it will be illuminated by 20 forty watt tungsten lamps or equivalent. The track will be carried on small concrete arches. Small boat slips will be built at each end of the railway.

Water for filling the lock will be drawn from the upper pool through a large culvert built in the rear of the south upper extension wall to valve chambers in the side walls of the lock above the upper gates, thence passing down shafts formed in the breast wall into a single culvert under the lock floor from which it will discharge into the lock through openings in the floor. The lock will be emptied through valve chambers in the culverts under the south wall in front of the lower gate, the water being drawn into the culverts through the openings in the floor.

The head of the lock will be protected by a movable

dam consisting of a small deck girder bridge and steel stop logs.

The lock chamber will be 167 feet long and 33 feet wide between the faces of the vertical side walls.

The Dam

The dam is built across the river from the upper end of the south entrance pier at the upper end of the lock to the south shore, a distance of about 230 feet. The dam is divided into two sections, viz., a supply weir at the north end consisting of three sluices each 20 feet wide and 24 feet deep for the supply of water to the power house which is below the dams and a spillway 120 feet long by 60 feet high above the solid rock in the centre of the river. The crest is divided into sluices over which a reinforced concrete platform is built. Slots in the platform are left to allow of the operation of the stoplogs on the platform.

A travelling gantry crane constructed by the Herbert Morris Crane and Hoist Company has been installed to raise or lower the stoplog controlling the entrances of the power house wheel shafts and Venturi sluices when necessary.

Water Turbines

These wheels were supplied and installed by the Boving Hydraulic and Engineering Company under contract dated July 4, 1916. The installation consists of three twin horizon-

Up-stream view of Swift Rapids dam, showing 5-section spillway on left and three turbine bay openings on the right.

Oil switches and overhead distribution, Swift Rapids, Severn River

Lightning arresters, spark gaps, choke coils, etc., Swift Rapids

tal turbines each capable of developing 2,120 b.h.p. under 45 feet head when running at 257 r.p.m. Each turbine has two runners with buckets of steel plate cast into the rim and hub, two guide cases with balanced movable vanes of cast steel bronze bushed and connected by short bronze bushed links to the regulating rings, and one draft chest of cast iron, split horizontally and vertically and provided with two man-holes.

Two features of the turbines call for comment viz., a central bearing of lignum vitae type which is adjustable from the outside by means of bronze screws, and tightening boxes for the turbine shaft which is water sealed and requires no packing material, thus doing away with the wear of the shaft. The turbine shafts are $9\frac{1}{2}$ inches in diameter and consist of open hearth steel. Each turbine weighs approximately 73,000 lbs.

The turbines are regulated by three automatic oil pressure Lombard governors, which are extremely sensitive and fitted with mechanical hand regulating devices which also

allow hand gate adjustment when the governor is being dis-assembled.

For exciting current purposes there is a single horizontal turbine designed to the following data: Effective head 44 feet; maximum output 150 b.h.p.; normal output 125 b.h.p.; normal speed 700 r.p.m.

Generating Machinery

The work of supplying and installing the generating plant and switchboard was carried out by the Canadian General Electric Company. There are three generators of 1,500 kv.a., 257 r.p.m., 2,300 volts, 3 phase, 60 cycles, which are directly connected to the water wheels. They are of the revolving field type. Exciting current can be provided from either of the two d.c. generators which are equal in capacity. One is directly connected to a water wheel and the other is part of a three bearing motor generator exciter set. These

Electric generating equipment in Swift Rapids plant—Three 1500 kv.a. units

two generators are interchangeable in all respects. They are rated at 83 kw., 690 r.p.m., 125 volts.

The induction motor which is connected to the exciter is 125 h.p., 720 r.p.m., 2,200 volts.

The stepping up transformers are three in number, each of 1,500 k.v.a. and 3 phase. Taps on the high voltage winding allow for 25,000, 24,000 and 23,000 volts. They are water cooled core type and fitted with bell alarms and dial type thermometers. For power house and local services three 50 k.v.a., 2,200 to 110-220 volt transformers are provided.

The switchboard is in a gallery above the level of the main floor and between the high-tension room and transformer compartment. The panels are of natural black slate mounted on pipe supports. The instruments have a dull black finish and the board has a very neat appearance. The end panel is on a swinging bracket and holds the synchronizing indicator and voltmeters. This allows the operator to keep the instruments in view when at any part of the board and is a convenience when parallel operations are in progress. One feature of the switchboard that may be mentioned is a three circuit graphic polyphase wattmeter with re-roll attachments. This instrument records the total load of the three generators.

The stepped-up current is conveyed through conduit from the ground floor to the third storey of the power house where the high tension bus is situated. There are three high tension lines (3 phase) proceeding from the building. Two are used for Orillia and the third as a tie line between the Swift Rapids plant and the Big Chute. One or other of the Orillia lines can be used for connection with the Wasdells Falls plant. For some time all three generating plants on the Severn River and the Eugenia Falls plant have been run in parallel, namely, Eugenia Falls, Big Chute, Wasdells Falls and Swift Rapids. The first three plants are operated by the Hydro Electric Power Commission of Ontario.

The Swift Rapids plant was first operated in November, 1917, and from that time to the date of the signing of the armistice the machines were loaded to full capacity. Owing to demands of munition manufacturers who were working night shifts there was practically no peak. Consequently, load factors ruled high and the average for 1918 was 72 per cent.

Mr. J. B. McRae, consulting engineer, of Ottawa, was responsible for the plans of the power house and plant. With him was associated his colleague, Mr. J. C. McLaren. The late Mr. W. K. Greenwood as engineer of the Orillia Water, Light and Power Commission and Mr. George Page, power house superintendent, were also intimately in touch with the work during both its inception and construction. For the information contained in this article we are indebted, in part, to the late Mr. Greenwood, and in part to Mr. F. Gover, secretary Orillia Water, Light and Power Commission.

Good Lighting Necessary at all Points

Our manufacturers have been somewhat tardy in seeing the beneficial side of good lighting. It is only lately that employers have recognized the fact that good lighting increases production and decreases accidents. Very often, however, good lighting is confined to certain sections of a plant. There are many places in factories, particularly in the ground floor of sawmills, where little or no attention is given to illumination. When it is realized that most sawmills in the Province generate their own electricity for lighting purposes, it is hard to understand the laxity displayed on the part of some of the owners and managers of these plants in not having sufficient lighting provided. In several cases the inspector had to be furnished with a lantern in order that a proper inspection could be made, notwithstanding the fact

that electric generators form a part of the equipment of these plants.

An instance can be cited where from purely economic reasons sufficient lighting had not been provided, with the result that a fatality has to be recorded owing to that neglect.

In general, good lighting in factories and workshops not only facilitates the work direct, but is of the greatest indirect value because of the feeling of security given the workers. Such being the case, it naturally follows that the inspector, while making his official visit, will carefully scrutinize the system of lighting in force, and numerous orders have been issued to install more lights at certain designated points.

While this department has set no standard for this very important provision, nevertheless we have at all times insisted that proper illumination must be provided.—From report of Inspector of Factories, Public Works Department, British Columbia.

Power Development at Drummondville

The Southern Canada Power Company has completed the construction of its new dam and power house, of concrete, at Drummondville, P. Q., and is now proceeding with the installation of the hydraulic and electrical machinery. Provision is made for four units, two of a total of 7,000 h.p. now being completed. The equipment includes two 3,150 k.v.a., 60 cycle, 2,300 v., a.c. generators, direct-connected to vertical turbines, under a 32 ft. head. There are two 100 kw. 125 v., d.c. exciters. The transformers are 1,000 k.v.a. oil insulated and water cooled, stepping up the voltage to 48,000. The consulting engineer is Mr. W. Kennedy, jr., Montreal. The electrical machinery is of Canadian Westinghouse make, the turbines, Boving Hydraulic & Engineering Co., Ltd., Lindsay, Ont.

Opportunity for Canadian Manufacturers

An important announcement has been made by the Secretary of State for the Colonies to the effect that all restrictions on imports into England from British Colonies have been removed. It is made clear, however, that this refers only to goods produced or manufactured in the Colonies.

It is pointed out, at the same time, that this offers a splendid opportunity for Canadian manufacturers, as British stocks, in general, are low. The announcement, of course, amounts practically to a preference in favor of Colonial goods. It will doubtless mean the establishment in Canada of numerous branch factories of United States and other foreign industrial concerns.

It Costs Money to Break Poles

A wireman was fined in the Toronto police court on Friday, March 14, for having deliberately pulled scrap wire into a conduit pipe. Such criminal violation of the wiring rules calls for a heavy penalty and the offender got it, being fined fifty dollars and costs for violation of the rules, forty dollars further which he must pay to the owner of the place for loss of time while the power was shut down, and a further sum of eighteen dollars to another wireman who was called in when the old wire short-circuited to make repairs.

The total operating revenue of the Western Canada Power Co. for 1918 amounted to \$448,709 as against \$450,161 in 1917. Operating expenses were \$163,418 as against \$130,559, leaving net operating revenue at \$285,291 as against \$391,601, a decrease in the year of 10.74 per cent. Other revenue brought gross income up to \$294,079 against \$331,794, an increase of 11.37 per cent.

Joint Committee of Technical Organizations Hold Successful Annual Meeting

The Third Annual Meeting of the Joint Committee of Technical Organizations was held in the Physics Building on the evening of Monday, March 24th. The chairman, Mr. Geo. A. McCarthy, presided. There was a large attendance of technical men. Three main items of interest composed the program—Mr. McCarthy's report and addresses by Mr. Tom Moore and Mr. J. F. M. Stewart. Mr. McCarthy outlined the activities of the Joint Committee for the past year as follows:

Annual Report 1918-1919

To the Technical Men of the Province of Ontario.

Gentlemen:—Your Committee has pleasure in submitting its third annual report covering activities during the year ending March 24th, 1919. The executive held about forty-five meetings during the year and twelve meetings of the general committee were also held.

Changes in By-Laws

The By-laws have been revised so as to separate the office of secretary-treasurer, and in future there will be a secretary and a treasurer to conduct the affairs of the committee. A further revision has been made so that the Joint Committee will now hold its meeting for the election of officers shortly before the annual meeting instead of immediately after.

Inventions

The work of the Inventions Committee was carried forward until the signing of the armistice, at which time activities of this committee were completed. The following letter from the Imperial Munitions Board to the members was very much appreciated.

December 26, 1918.

Dears Sirs:

Owing to the cessation of hostilities the work of the Inventions Committee of the Board naturally comes to a close. I am sorry Colonel Carnegie is not here to give me a clearer view of the unselfish work done by the members of the committee during these years of war. In his absence I must content myself with simply expressing personally, as well as officially for the Ministry, deep appreciation for the time and effort which you have given to the work of this committee.

With sincere regards, believe me,

Yours faithfully,

J. W. Flavell, Chairman.

Questionnaire No. 3

It will be remembered that Questionnaire No. 3 which was distributed to all industries by the Honorary Advisory Council for Scientific and Industrial Research, was handled in that portion of Ontario west of Ottawa, by this committee. Final returns were made to Ottawa during the beginning of the year and the work of this sub-committee thus completed.

War Scholarships

During the latter two years of the war period, one of the most important functions of the Joint Committee was in connection with the supplying of technically trained men for war purposes. This function involved the securing of graduate engineers for active service overseas and of technically trained men for service under the Imperial Munitions Board in munitions plants. Being thus in close touch with various sources of supply for these classes of men, the Joint Committee in the early part of 1918 was confronted with the following conditions:

Just previous to the outbreak of the war, the normal en-

rollment in the Faculty of Applied Science of the University of Toronto was 700 to 800. The enrollment in 1917 was 150, and the classes were subsequently very greatly reduced through enlistment.

In the spring of 1914, 145 men were graduated in Applied Science. The graduating class of 1918 numbered 23, and several of these were absorbed by the war before they could write on their examinations.

On the recommendations of the Joint Committee, three men were on one occasion removed from the chemistry course in Toronto University to take positions in munitions factories. They had only written their first year examinations, but the urgent needs of the war had to be met with such material as was available.

It was reported that early in 1918, the Applied Science classes at Queens were only one-fifth of normal, and that at McGill the conditions were quite as bad, if not worse. There was not a single student in electrical engineering at McGill at that time.

There were three phases of the very serious problem arising out of the above described conditions—first, the matter of supplying the then immediate need for qualified engineer officers; second, the supplying of the need of such men two or three years hence, if the war lasted that long as then seemed possible; and beyond this again the problem of supplying the very vital need of qualified engineers to meet the demands arising out of the "post bellum" reconstruction period.

In connection with this problem it seemed evident that the primary need was to stimulate, by home means, the enrollment of students in the engineering courses of our national universities, and a sub-committee was formed for the purpose of devising some means toward this end. The sub-committee took immediate action and as a result of a conference with the Provincial Department of Education, a report was submitted in which among other things it was set forth that the establishment of cash scholarships stood first as the most effective means of stimulating the enrollment of engineering students. To this end it was recommended that four scholarships of \$100.00 per year each, and four scholarships of \$50.00 per year each, be established in the engineering faculties of our national universities. This report was adopted by the Joint Committee and elaborated in the form of a circular which was sent out in July, 1918, to all of the high school and collegiate principals in the Province of Ontario.

This circular elicited favorable comment and one concrete result of the action of the Joint Committee was the adoption of the scheme by the Engineering Alumni Association of the University of Toronto. The Alumni Association took the matter up at once with the University of Toronto authorities with the result that the eight scholarships mentioned were actually established, a competitive examination was held on January of the current year and the scholarships awarded to the eight successful candidates. The funds for these scholarships were raised by the Alumni Association through an appeal to the industrial interests of the Province. It is understood that this general appeal met with so generous a response that the war scholarships scheme of the Toronto University Engineering Alumni Association is now a firmly established institution.

A further indirect result of the activity of the Joint Committee along the above lines has been the influencing of some of the larger industrial organizations to establish private scholarships schemes. Such projects are now being seriously considered by the Canadian Pacific Railway, the International Nickel Company, the International Harvester Co., and other similar organizations.

On April 1st, 1918, the officers in charge of the Canadian Engineers had appealed to the Joint Committee to assist

them in obtaining candidates for commissions in that branch of the service. Work was immediately commenced by the Joint Committee and information was received from Ottawa, April 22nd, advising that more than enough applications had been received.

Confidential reports have been made on applicants for commissions in the Canadian Engineers to those administering this branch of the service.

Round Table Conference

During the summer of 1918, the Joint Committee began investigating labor conditions and together with the Canadian Manufacturers' Association which was carrying out a similar action, formed a Labor Committee. This committee had an interview with the Labor Committee of the Cabinet at Ottawa and out of this conference developed the Round Table Conference on November 29th at Ottawa, between representatives of the Trades and Labor Congress, the Joint Committee of Technical Organizations and the Canadian Manufacturers Association. It was felt by all concerned that the engineers had formed the cementing link between the Trades and Labor Congress and the C.M.A. Some of the points put forward for consideration in a reconstruction platform by the sub-committee of the J.C.T.O. were as follows:

- Ministry of Reconstruction
- Industrial Engineering and Research
- Technical Education
- Public Works
- Water Power
- Railroads
- Canals
- Raw Materials
- Mineral Resources
- Fuel Administration
- Public Welfare
- Tariff

At the conclusion, several representatives commented on the pleasurable surprise that the meeting had afforded. It was felt that the occasion was of historic moment, being the first time in Canada that Labor and Capital had met for the avowed purpose of mutual benefit. That so much common ground had been reached was thought to be extremely gratifying.

The recommendations drawn up at the conference were presented to the Cabinet about one week afterwards. A considerable reflex may be seen in some of the legislation now under consideration. The outcome of this event should be taken as pointing to a very definite field of useful activity for such an organization as the J.C.T.O.

Leading out of the interest of the Joint Committee in labor matters, the secretary of the Joint Committee was appointed a member of the Labor Committee of the Cabinet and by that Committee was appointed Deputy Vice-chairman.

Professional and Business Occupation Section, Department of Soldiers' Civil Re-establishment

In December, the suggestion was put forward by the Joint Committee to Mr. H. J. Daly, Director of Repatriation that the Labor Bureaus in various centres in Canada, would not assist materially in the placing of returned professional engineers and the higher types of business executives. It was suggested that special offices be opened in the larger centres to take care of these types of men. After further presentation of the facts to the Committee on Repatriation and to the Department of Labor and the Department of Soldiers' Civil Re-Establishment, it was decided that such offices should be opened in various parts of the Dominion.

An office of this kind has been opened in Toronto and already the results are beginning to justify the efforts put forth.

At the meeting of the executives of the organizations represented on the Joint Committee, such matters as pub-

licity by engineers, scholarships, training of research men, assistance in connecting the link between employer and employed, etc., were discussed.

A motion was unanimously carried that it was the feeling of the meeting that the Joint Committee of Technical Organizations should be carried on and that a budget be prepared outlining the financial requirements of the Joint Committee, together with an idea of the work that is to be carried on and that amounts should be allocated to the various organizations represented on the Joint Committee, having in mind the strength of these various organizations.

Financial Report

The financial report shows a balance on hand of \$356.25. It will be appreciated by all persons interested in this work that each individual must make some effort to see that financial support is given to the movement if the good work is to continue.

Industrial Relations—Labor's Standpoint:

The chairman then introduced Mr. Tom Moore, chairman Dominion Trades & Labor Bureau, to speak on "Industrial Relations—Labor's Standpoint."

Efficiency, Mr. Moore said, from Labor's viewpoint, was not judged by the standard of dollars and cents or the unit of output, but in its effect on human happiness and contentment. He condemned the so-called "efficiency" systems which had sought to standardize human beings and to make them, as far as possible, mechanically perfect. Such systems had brought labor to believe that capital had no interest in a man beyond the number of movements that could be got out of him in a day's work. The monotony of continuously repeating one small operation, also, was deadening to the human mind, and while by means of this specialization higher efficiency had been at first obtained, the ultimate result was a lower standard of efficiency, due to the harmful effect upon the workman. Real efficiency could only be brought about by the contentment of the workers, and to produce this contentment the conditions surrounding them, both in the factory and in their homes, would have to be congenial. Better housing was urgently needed and safer and more sanitary conditions generally in industry. Neither would the workers be satisfied until they were given their share in the management of industry, and it was the duty of the manufacturers to educate them so that they would be capable to take part in this control. An obstinate, stand-pat attitude on the part of the employers would result in labor seizing what they believed to be their right by force. Such action would be disastrous at present, as in the case of Russia. The country, therefore, must make provision for the situation and gradually educate the workers along these lines.

The Employers' Standpoint

Mr. J. F. M. Stewart spoke for the employer. Mr. Stewart said that the reasonable, fair-minded labor man and the reasonable, fair-minded employer are to-day looking at the problems before them through nearly the same size spectacles, but unfortunately there were extremists, and the extremist on the labor side was probably the more dangerous. When the armistice was signed labour was nervous and fearful of unemployment, as also were the employers, but it was to the credit of labor, during the months of readjustment, that it has, on the whole, played fair and, generally speaking, co-operated in this enormous task. The manufacturers, too, never tackled a problem with more serious misgivings and more anxiety, nor with more determination than they have tackled this problem of peace readjustment.

With regard to the future, Mr. Stewart was very opti-

mistic. He said: "Having regard for present day conditions in this country, which are not bolstered up in any way, I would predict that when Canada's real effort gets under way by, say, the middle of this summer, that there will be a real shortage of labor."

The immediate and pressing need, the speaker pointed out, was for capital and labor to keep firm and steady. He did not suggest for a moment, however, that the problems of labor should be relegated to the background. One measure, he warned against was the undue shortening of the working day. Hours of labor had been gradually reduced, and employers recognized that this should be so, but to make the working day in Canada six hours, as has been proposed, is not possible. He believed, however, that the workers should be taken much more into the confidence of the management of industrial plants. The workman was entitled to recognition of his rights as a person. Also, there was social legislation of which he was in favor—such as mothers' pensions and old-age pensions. Finally, he pointed out the big opportunities before capital and labor in this country, and he believed that, working together, they could make it the happiest home on earth.

Sufficient Power for Twenty Cities—Southern British Columbia is Rich in Important Water Powers

In British Columbia, there are many important water-powers. The investigation of the water-powers of British Columbia by the Commission of Conservation has disclosed the existence of two great water-power centres, namely, Nelson, with 400,000 h.p. within a radius of fifty miles, and Vancouver, with 300,000 h.p. within the same distance. Based on experience at Toronto, these quantities would suffice for a population of 1,700,000 at Nelson, or for 10 manufacturing cities of 170,000 each. The power near Vancouver would suffice for one manufacturing city of 1,250,000 population, or for 10 cities of 125,000 each.

There are 12 power-sites in British Columbia of 50,000 h.p. and upwards. With the exception of the South fork Quesnel and Peace river, all these powers are less than 125 miles from the 49th parallel.

Kootenay river, Upper and Lower Bonnington

falls, possible development	125,000 h.p.
Pend d'Oreille river, Waneta	73,000 "
Pend d'Oreille river, Salmon river	50,000 "
*Thompson river	100,000 "
*Fraser river, Hellgate	200,000 "
Bridge river tunnel	70,000 "
Stave river, lower site	52,000 "
Stave river, upper site	52,000 "
Coquitlam-Bunzton, north arm Burrard Inlet	84,000 "
Campbell river, possible	100,000 "
South fork Quesnel river	90,000 "
Peace River canyon	100,000 "

There are 18 power sites of between 20,000 and 50,000 h.p. Eight of these sites are distant less than 100 miles from the 49th parallel.

Kootenay river, Cora Lynn to Granite rapids	22,000 h.p.
Kootenay river, rapids near mouth	20,000 "
Pend d'Oreille river, Nine-mile falls	32,000 "
Pend d'Oreille river, Fifteen-mile creek	34,000 "
Columbia river, Long rapids	30,000 "
Adams river	30,000 "
Barriere river, ultimate development	20,000 "
Murtle river, Helmcken falls	20,000 "
Nahatlatch river, rapids below lakes	30,000 "
Jones lake (Fraser river)	25,000 "

Jordan river (25,000 h.p. developed), ultimate	38,000 "
Cheakamus river, Bear Mount canyon	40,000 "
Powell river (24,000 h.p. developed) ultimate	32,000 "
Nechako river, Grand canyon	30,000 "
Nechako river, Tetachuck falls and rapids	30,000 "
Bulkley river, Hagwilget canyon	20,000 "
Nass river, falls below Cranberry river	20,000 "
Nass river, rapids and falls below White river	20,000 "

*Development barred owing to presence of railways.

There are 29 power sites of between 10,000 and 20,000 h.p. capacity and 585 of less than 10,000 h.p. The report of the Commission of Conservation on the Water Powers of British Columbia includes all available data respecting 644 water-power sites.

Assisting Returned Technical Men

An appeal for co-operation in assisting returned technical men was made by Mr. Fraser Keith, secretary of the Engineering Institute of Canada, at the Montreal Electrical Luncheon on March 19th. During the next ten years, said Mr. Keith, Canada would witness the greatest industrial expansion in the history of the world. This would involve the development of our natural resources, and the connecting link between these resources and their conversion into national wealth was the technical man. Every advancement has been made by the solution of some technical problem. Besides our wonderful natural resources, one of the greatest assets that Canada possessed was the technical man, a fact which was not generally recognized. Technical men would be needed as never before. There was, however, a very serious danger confronting this country. The war had drained the universities and technical schools of some of the very best men, and the danger was in connection with the return of these men. If they were not assisted in the matter of finding suitable positions the technical knowledge gained before the war would be lost. The co-operation of the Federal Government and the various technical associations had been asked with a view to solving the problem. It was absolutely necessary that some scheme should be devised whereby the technical men should be established in civil life. Between 3,000 and 4,000 technical men had gone overseas, and the country owed these men everything that was possible in the way of assisting them to secure suitable positions. He asked the co-operation of those present to this end. It was agreed that the Committee of the Luncheon should assist in the way suggested by Mr. Keith.

Tenth Annual Report of H. E. P. C. O.

The third volume of the tenth annual report of the Hydro-electric Power Commission of Ontario, for the year ended October 31, 1917, has just been issued. This comprises 196 pages of hydrometric data gathered during the year October 1, 1916, to September 30, 1917, on the waters of the province of Ontario. At fifty-seven stations the stream flow has been under regular observation and the results for the year are given in this report. With the object of bringing the publication of stream flow data under the same water year as that adopted by Federal and other sources, the year October 1 to September 30, will be used by the Commission in future publications.

Under a Bill introduced into the Quebec Legislature, amendment is made to the law whereby power companies expropriate land on which to erect transmission lines. At present they are obliged to buy more land than is needed, and the change is to allow them to take only what is actually required.

Ontario Hydro Commission Building a Half Dozen Locomotives to Supplement 12 Already Operating on Chippewa Work

The Hydro-electric Power Commission of Ontario are building for use on the Niagara Power development six electric locomotives of which the following is a general description. These six locomotives will supplement 12 other smaller locomotives at present in operation at the Falls development and numbered E. to E12:

General Dimensions

Length overall	41 ft. 0 in.
Length of truck centres	25 " 0 "
Length of main cab	16 " 0 "
Length of auxiliary cab	9 " 6 "
Width over main cab	9 " 0 "
Width over side sills of locomotive	9 " 0 "
Width over auxiliary cab	6 " 6 "
Height of rail to bottom of side sills	3 " 4 "
Height of rail to centre of coupler knuckle	2 " 10½"
Height of rail to top of roof	12 " 8½"
Truck wheel base	7 " 0 "
Track gauge	4 " 8½"

The locomotive is designed for double end operation for either switching or road service. Both ends are symmetrical about the centre line across the body, the total weight, including equipment, being 100,000 lbs.

Trucks are of the arch bar type with M.C.B. class C springs. Wheels are 36-in. chilled grey iron M.C.B. 1912 profile; axles M.C.B. 5½-in. x 10-in.; journals with centre between hubs of wheels of 50-in. to take motor bearings and cast steel gears which are pressed on the axle.

Under frame has six 12-in. I beams at 40 lbs. sills the full length of the locomotive with 8-in. I beams at 25 lbs.; cross sills rivetted to longitudinal sills; end buffers 15-in. channel at 33 lbs. rivetted to sides of longitudinal sills; bolster 1-in. x 14-in. x 9-ft. 0-in. longitudinal sills.

Main cab box type with two side doors; two end doors, four side windows, four end windows and removable doors between the main cab and hoods.

Two hoods are located at each end of main cab with two removable doors on one side of each hood. Carlines and posts in hoods and main cabs are standard structural shapes with inside finish in main cab only.

Additional ballast is added in flooring by placing solid cast iron slabs 2¾-in. thick by 18-in. by 9-ft. 0-in. long in the floor under the hoods at each end only. This ballast weighs altogether 24,080 lbs., and brings the weight of body truck equipment, etc., up to the required 100,000 lbs. total necessary for proper tractive effort.

The electrical equipment consists of four G.E. 66 B motors 125 h.p. each, two mounted on each truck; type M. multiple unit control consisting of 2 sets of D.B. 31 contactors, each set consisting of 13 contactors; 2 D.B. 20 reversers; 10 frames of rheostats; 2 C. 6 controllers; 2 B.T. 335 junction boxes; necessary kicking coils, lightning arrester, main switch, motor cut-out switches, fuse boxes, choke coil control switch, lighting headlight and heater switches, trolleys, etc.

Each pair of two motors is wired up in such a way as to give two sets of equipment separate and distinct from each other which are paralleled together in each controller, one of which is at each operating end. Located in front of each operating position where they can be readily seen and used in operation and under the hood is one set of contactors, one reverser, air gauges, whistle valve, sander valve, dump line valves, ammeter and all control switches.

All control leads are special standard 19-25 wires and run

in conduit without colors, each individual wire being tested out before connection.

All main leads are special standard extra flexible wire and are run singly, each one in a separate conduit with the bellmouths and gaskets in each end for weather proofing and to prevent wearing of insulation on wires in operation.

Air brake equipment is Westinghouse No. 14 E.L. locomotive air brake as used by present steam roads with two 50 cubic feet motor driven air compressors, both located in main cab. Extra features are the dump line operating couplers, and valves used for operating 20 cu. yd. dump cars on the Niagara Power Development.

All compressors and control are equipped with multiple unit features so that it is possible for one operator to operate two or more locomotives from the one controller.

Four trolley bases are used due to the double end operation and side trolley wire construction used. The trolley wire on which these locomotives will operate is located 7 feet from the centre line of the track and 24 feet from the rail requiring the use of four trolley bases with poles bent out to reach this wire.

Interior finish of cab is painted dark green; floors, doors and sash, medium gray; outside body and truck, black; lettering and stripping in yellow; numbers E 13 to E 18 inclusive lettered Hydro-electric Power Commission.

Fundamentals of Readjustment

At the recent mid-winter meeting of the American Electric Railway Association, held in New York, one of the most important reports presented was that by the Committee on Readjustment. Mr. P. H. Gadsden, chairman of the committee, pointed out that there were certain fundamentals which must control the adjustment of the relations between the companies and the communities they serve, which his committee outlined as follows:

1. The electric railways of the country are breaking down under present conditions of operation. As a result, the public is being deprived of service and is facing certain financial losses through the depreciation of electric railway securities which are held by savings banks, life insurance and trust companies and other similar institutions in which its savings are invested.

2. This condition is primarily due to the economic error of establishing an inflexible fare regardless of the cost of the service rendered or the distance hauled.

3. To correct this difficulty, flexible fares must be established which will be automatically adjusted to the cost of the service demanded by and furnished to the community.

4. A necessary element of the cost of service is such a return on the fund employed as will attract capital to the public service. To provide incentive to enterprise and initiative, there must be an additional reward for economical management.

5. In the interest of the car rider, who must ultimately pay the cost of local transportation, every special impost and tax which cannot be justified upon the ground that it is payment for benefits received should be abolished.

6. To secure satisfactory service and keep fares as low as possible, the public must act on the principle of the "greatest good to the greatest number" and must co-operate with the operating companies in making effective economies by the use of "skip-stops," one-man cars, etc.; and the speeding up of schedules by reduction of vehicular interference.

7. Electric railway transportation is a community problem to be solved by the community and the company acting together and animated by a spirit of civic interest and devotion to the public service and having as its object the establishment of such regulations as will give the public the great-

est efficiency, economy and enterprise in the operation of their transportation utilities.

8. The committee proposes to carry out as rapidly and as effectively as possible the following program:

a. To furnish to members of the association at as early a date as possible, information concerning franchise settlements and agreements along service at cost and other lines.

b. To analyze these various agreements and present for the information of the companies such a summary of their provisions as will provide a guide in the drafting of new ordinances or agreements.

c. To directly assist communities in which the readjustment of franchise relations are under way.

d. To furnish at the instance of the railway company to civic organizations and similar bodies, information as to, and studies of, public utility questions.

Mr. Gadsden suggested two alternative solutions of the predicament in which the railways found themselves: (1) The general acceptance of some sort of service-at-cost plan, and (2) the adoption of some kind of municipal or governmental ownership.

N. S. Tramways Increase Earnings

The Nova Scotia Tramways and Power Company report sent out to shareholders today shows that despite labor difficulties, influenza epidemic, which reduced traffic, and daylight saving, which cut demand for lighting currents, the gross earnings show a slight increase over the previous year. Permission being granted by the Board of Public Utilities to increase the price of gas, the directors believe this department will be able to operate with a margin of profit, which was not the condition prior to the granting of the increase.

Mention is made of the Board of Public Utilities having ordered additions to rolling stock, and extensions and improvements in the present track layout. The report says the prospects for increased business in the various departments of the company's activities are bright.

A Zone System of Fares

The president of the Public Service Railway of New Jersey recently presented a plan before a hearing of the Public Utility Commission of that city, for a zone system of fares on the lines of his company. The rates recommended are as follows: A stand-by or ready-to-serve charge of 4c and a distance rate of 1c a mile, making the fare for the first mile 5c, second mile 6c, third mile 7c, and so on. A charge is also made for transfers; a ready-to-serve charge of 1c with a distance rate of 1c a mile, so that a one-mile transfer costs 2c, a 2-mile transfer, 3c, and so on. The fare would be collected on the pay-as-you-leave system, passengers receiving an identification zone slip as they leave. The company claimed that it was entirely practicable to collect fares on this basis.

Toronto Section A. I. E. E.

The Toronto Section of the American Institute of Electrical Engineers held their usual semi-monthly meeting in the Engineers' Club on March 21st. The address was by Mr. J. Lester Woodbridge, on "Storage Batteries." There was a large attendance and a spirited discussion following the address. The April 4th meeting will be addressed by Mr. George D. Leacock. The April 11th meeting will be held in Hamilton. The annual meeting is on April 25th.

The Gatineau Development Co., Ltd., of Maniwaki, P.Q., has been incorporated with a capital of \$99,000 to carry on the business of an electric light company in the township of Egan, and to deal in electric fixtures and supplies.

Cost of Reading Meters and Billing Customers Reduced

A considerable item in the expense account of the central station is the cost of reading meters and billing customers. The manager of a large plant who has been successful in effecting big economies, writes in "System" as follows:

Meter Reading and Billing Economies

If we keep on cutting corners we figure that pretty soon we'll get our collection expense down to 0. In postage alone we've cut our expense from \$50 to \$2.67.

We have done this by changing our method of getting our bills to our customers not once, but three times. In other words, we didn't stop with one improvement, even if that improvement did save us \$15. We made another and still another and we're not satisfied yet. I'm sure we can find at least one more cut to make.

We have 2,274 customers located in several towns. At one time we mailed out all of our bills. Of course we sent each customer's bill under personal cover.

That was when it cost us \$50 to get our bills to our customers. Our first saving—of \$15—came when we sent several bills under one cover. We had to revise our mailing lists to do it. If we had a customer who operated a store, we mailed his residence bill and his business bill in one envelop to his business address; if his salesmen were also customers we included their bills in the same envelop.

We were able to make many combinations like this and we had but few objections. Where we did we mailed the bills separately.

We were satisfied to pay \$35 to mail our bills for just a little while, however. Another change made it possible to cut down this cost still further.

In some of the towns in which we operate we have men working on regular monthly salaries. These men have miscellaneous duties; whether they are busy or not, their salaries go on just the same. If, then, we figure, we could get an additional necessary operation from this fixed expense, we would be saving the cost of that additional operation. So we arranged to have these men deliver the bills.

Just as soon as the bills are made out we send them to the local offices. Here they are sorted by street and number and dated; and then delivered.

That brought down the cost of getting our bills to our customers to \$8.83.

The last change we made was to cut out the bills altogether in those towns where it was practical to do so. Of course that meant a saving of much more than postage. We figure, roughly, that we have been able to save \$10.95 in office and collection follow-up work.

Formerly we read meters each month between the fourteenth and twenty-third. The statements would be made out in the central office and mailed to reach our customers on the first of the following month.

Bills were payable on the tenth. Few of our customers paid promptly, however, especially since we had to remove our prompt-payment discount on account of increased costs. That meant we had to wait until the twenty-fifth for our money, and to send a collector for it then.

So we decided to reach the meter, figure the charge, and collect the money all at one time. We furnished each reader with the necessary account and receipt slips.

We save at least an extra call, and we save a lot of clerical work in the office. We're able to straighten out a dispute right on the spot.

The \$2.67 postage we still pay is for bills to customers in those towns where we have not been able to make this last change. But we are hoping soon to bring those towns into line.

The Contractor-Dealer

"Greater Turnover" is the Problem of the Electrical Industry—Proper Machinery Must Be Supplied

Since Mr. Goodwin made his cursory visit to some of the electrical stores in Toronto, there is evidence that his few words of advice have taken effect, but no one could say that there is not still much room for improvement. The crying need not only in Toronto, but throughout the length and breadth of the Dominion is more electric stores and better stores. How can the industry prosper otherwise? The demand for electrical appliances is constantly increasing. The quantity and number is also increasing at a tremendous rate. Is it not true that the profits from the merchandising of electrical devices are attractive? Why then is there such a dearth of good electric stores?

The manufacturer says the answer lies in the fact that the merchandising of appliances has been left to a class of men who do not yet quite grasp the situation. They are not merchants by training—perhaps not even by instinct. They were contractors first and this, in many cases, still occupies the chief place in their attention. Yet no one can fail to see that the electrician, with his special knowledge of the trade, is the proper man to handle electrical goods.

The dealer, on the other hand, claims that the profits allowed by the manufacturer and jobber are not sufficient. He points, for example, to the shoe trade, where profits anywhere from 50 to 100 per cent. are readily obtained—and this, too, on constantly recurring sales. No one attempts to fix the retail price of shoes. No one insists on giving a one, two, three or five year guarantee. Why should the electrical appliance business be surrounded by so much red tape?

Between these two views it is surely possible to reach a solution. The big thing we are all after is—**increase in volume of turnover**. This means many electric stores, well-equipped with salesmen who understand electric goods, and also know the retail business, and this condition again is only possible if the inducements are sufficiently remunerative.

In a nutshell—we must make the electric retail business so attractive that plenty of good men will get into it.

A Mistake Today Will Retard the Industry Many Years

"Hardware dealers are a big factor to-day in the electrical field. In many places they are the dominant factor. Many of the largest firms would far rather have their various specialties handled through the hardware stores than through the electrical dealers. This may seem strange, but the explanation is simple. They have found by actual experience that the hardware dealer is a keen, aggressive business man, and that he will push sales in every possible way. Many of the electrical dealers on the other hand are content to take what business comes to them. Where the hardware man advertises aggressively and puts on nice window displays, and places the electrical lines he is handling at various points in his store where everyone who comes in will see them,

the electrical dealer very often is content with putting a couple of irons in the window and maybe not changing the window for a month. It is the easiest thing in the world for the hardware dealer to take away business from the electrical man under circumstances of this kind, and he has done it."

This is from a hardware journal that is making a big bid for the support of the electrical manufacturers and jobbers. It is true only insofar as it indicates that electrical contractor-dealers are not sufficiently aggressive. It is not true that hardware stores in general push the sale of electrical appliances. They simply stock a few of the most attractive looking of them. As pointed out in these pages frequently, the hardware merchant is not in sympathy with the electrical industry. He knows and cares nothing about it beyond the mere profit it brings him as a side issue. Neither does he make friends of the industry among his chance customers, because he is in no way equipped to give these customers electrical **service** in the form of information, advice, repairs, etc. And the placing of electrical devices, as we electrical men all have found out by bitter experience, is almost purely a matter of "service." In other words, selling electrical appliances is largely the sale of an "idea." Consequently the appliance does not "stay" sold unless the **idea** is maintained by a constant and efficient service.

Does it not follow then that the ultimate result of the placing of electrical appliances in the hands of hardware merchants would be entirely detrimental to the electrical trade? We think so and we strongly urge that manufacturers and jobbers who may have thought of following this path of least resistance should reconsider whether, in the end, their business would not be much more voluminous and profitable if handled by the contractor-dealer who **knows** these goods.

It may be true, and we will admit for the sake or argument that it is, that hardware men are more experienced merchandisers than are the contractor-dealers. This, however, is a defect that can be remedied. There is no reason why electrical contractor-dealers should not be schooled in proper methods of retailing. On the other hand it will never be possible to excite the interest or gain the sympathy of the hardware dealer because his interests and sympathies are already spread over an almost infinite field. The only thing that attracts his sympathy is "profit," and if nails or bolts yield him more profit than electric toasters and give him less trouble, then his sympathies will lie with the nails and bolts.

The item quoted alone, however, indicates that a definite propaganda is under way to disorganize the electrical industry. It is a serious situation enough. It is not alone the electrical dealer that is affected, but the whole trade. The dealer problem, however, is the crux of the whole situation, because he is the funnel through which, ultimately, the products of the whole industry must pass to the consumer. If our contractor-dealers are properly organized and properly equipped for merchandising there is scarcely any limit to the possibilities of expansion in the electrical trade. If, on the other hand, the merchandising of these goods should get into

the hands of any unsympathetic group of retailers, the whole industry may easily become dwarfed and stagnant.

It is a question that must be met and solved, and solution can only come, we believe, by the close working together of manufacturer, jobber and contractor-dealer so that a comprehensive and sufficient scheme may be worked out and carried out.

Toronto Electrical Contractors Launch the Open Price Plan

The Toronto Electrical Contractors' Association, as intimated in our recent issues, have taken the plunge and launched the "Open Price Plan" of submitting tenders.

The whole plan is very clearly outlined in an information sheet just distributed by the Open Price Committee. It will be noted that the information is being exchanged through a central office or "Clearing House," just as banks daily distribute and exchange their bills, cheques, drafts, and so on. The "Information Sheet" is reproduced below and is fully explanatory:

INFORMATION OPEN PRICE PLAN

EFFECTIVE MARCH 24, 1919.

of

Toronto District—The Ontario Association of Electrical Contractors and Dealers

Toronto, Monday, March 10, 1919,

1. The Open Price Plan is open to every member of the Association. Each member will be supplied with the following forms:—

- (a) Information Sheet.
- (b) Forms for copy of tenders and summary of estimate.
- (c) Printed Envelopes to "Clearing House."

2. Each member shall report to "Clearing House" as follows, at the same time and by the same means by which original tender is sent. (That is, by mail, phone, etc.)

- (a) **Two Copies** of Original Tender, with summary of estimate.
- (b) Enclosed in printed envelope to "Clearing House."

It is important to fill in all information on Summary of estimate.

3. Upon receipt of this information, "Clearing House" will exchange this information with all others—who have reported tenders—on the same job.

4. Successful contractor shall report by letter in duplicate to "Clearing House" immediately upon closing job, that same has been closed and the price.

5. Notice of award will then be mailed by "Clearing House" to all members who have tendered on job.

6. Meetings will be held, in addition to the regular business meetings of the Association, for the express purpose of discussing all the information obtained and the subjects of estimating and cost accounting. (Minutes of these meetings may possibly be exchanged for those of similar meetings in New York and Chicago).

The adoption of the Open Price Plan is the result of Mr. Goodwin's suggestion at our meeting of January 31st, 1919. The preliminary form of the Open Price Plan, as unanimously adopted at the meeting of March 6, 1919, was reported to that meeting by the Open Price Committee, composed of the following members:

Mr. Harris—Harris and Marson.
Mr. Salisbury—The Salisbury Electric Co., Ltd.
Mr. Hicks—Harry Hicks Co.
Mr. Wood—Wood Electric Co.
Mr. Cruise—Toronto Electric Co.
Mr. Kay—Bennett and Wright Co., Ltd.

Mr. Gray—R. A. L. Gray and Co.
Mr. E. C. Clarke—The Clarke Electric Co.
Mr. Myers—J. Everard Myers.
Mr. Drury—E. A. Drury.
Mr. Rooks—Rooks Electric Co.
Mr. McIntyre—Beattie-McIntyre, Ltd.
Mr. Rohleder—Harry Alexander, Incorporated.
Mr. Ramsden—Ramsden and Roxborough.
Mr. H. H. Windeler—Windeler Brothers.
Mr. B. L. Clark—Canada Electric Co.
Dr. Walter R. Carr, Ex-officio.
Mr. F. W. Wegenast (Counsel) Ex-officio.

Out of the above eighteen, sixteen were present at the meeting, indicating the intense interest in the Open Price Plan.

A later meeting of the Open Price Committee was held March 20, 1919, at which it decided to recommend the immediate adoption of the complete Open Price plan, as outlined above.

The object of the Open-Price Plan is to educate our members in proper, standard methods of estimating and cost-accounting, including the vital subject of "**Overhead Expense.**" Discussion of a general nature can go only so far. The practical results will be obtained by thus exchanging information with each other. Discussion will then become specific.

The object of the Plan is **not to fix prices**, but to stabilize prices by publicity, much in the same fashion as transactions in stocks and bonds are listed on the Stock Exchange. Prices are made known only after they have been quoted. Also monthly reports will be sent in as to monthly cash receipts, pay roll, etc.

The effect of the Open Price Plan will be to—

- 1. Give our members confidence in one another, tending to replace distrust and suspicion.
- 2. Stabilize prices.
- 3. Make our business more efficient.
- 4. Competition will be based more on efficiency and less on ignorance.
- 5. Increase business with less cost for estimating.

The success of the Open Price Plan depends upon yourself.

OPEN PRICE COMMITTEE, TORONTO DISTRICT.

N.B.—Phone "Clearing House" for additional report forms and envelopes, as required.

Hear Mr. Wetherbie's Talk on Merchandising

The regular monthly meeting of the Toronto Electrical Contractor-Dealers' Association will be held in the King Edward Hotel on April 3rd. It happens that the salesmen of the Canadian General Electric Company are in conference during the same week and one of the items on their program is a sales talk by Mr. Wetherbie, sales manager Fan and Motor Department of the General Electric Company. It has been arranged that Mr. Wetherbie's address should be withheld until the evening of April 3rd and delivered before a joint meeting of the Canadian General Electric salesmen and the electrical contractor-dealers. This is a splendid opportunity for electrical contractors to gain some valuable information on modern methods of merchandising and it is hoped there will be the fullest possible attendance. Remember the date—King Edward Hotel; 8 o'clock; April 3rd; Sales Talk by Mr. Wetherbie.

In a bill now before the Massachusetts Legislature it is provided that the Lynn street railway be operated by funds from general taxation and that no fares shall be collected on the cars.

How to Put on An Electric Cleaner Campaign

This is the brief outline given in the March Monthly Sales Service of the Society for Electrical Development of a month's campaign that sold 112 electric cleaners of a well-known make in an Eastern city. The profit on the campaign was stated by the company to be "over \$900 on the cleaners alone." In addition there was an increase in merchandising receipts of 1023.7 per cent. over the same month a year before.

This is how they did it. It is interesting to note that the sales manager of this lighting company was skeptical of cleaner sales; he knew little of the article but finally listened to the suggestions of the manufacturer's representative to buy 12 machines and display them in his show-room. If they sold he would re-order and possibly try out a campaign.

The 12 machines arrived, and were displayed on display, alongside two other makes of cleaners. After two weeks the machines were still on the floors unsold. This proves the contention that electrical specialties will not sell themselves; people don't stroll in and buy cleaners, washers, and the like—they have to be sold. This is principle number one in conducting such a campaign.

Not discouraged, the manufacturer's man finally persuaded the manager to let him put two men in the city, to prove that the cleaner could be sold and would stay sold. He agreed to prove that he could move between 75 and 100 cleaners in four weeks intensive campaign. Since the manager had on a previous campaign sold only 10 cleaners he had his doubts, but he was game, and went ahead.

The company had 6,000 residence customers connected to the lines. These customers were listed on an individual and plain 4 x 7 "prospect card." They were all sorted into 28 different districts or routes in order to save time in solicitation. The prospect's telephone number was placed on the upper right hand corner of each prospect's card.

Two men were sent from the jobber's office to work with the company. They were experienced cleaner men; they helped educate the central station's own representatives. At the outset it was made plain that the cleaner must not be "over-sold," no mis-leading statements were to be made and courtesy to the prospect and customer was to be the keynote. A girl was employed who was to call up the customers of the company by phone and arrange for demonstrations to be made in the prospect's homes. The advertising consisted of an 80 inch advertisement in the paper each week of the campaign, but on different days in each of the four local papers. Advertising pamphlets and folders were enclosed in the monthly lighting bills rendered to the company's customers. In every way possible the cleaner was brought to the attention of people who had electricity in their home.

Opening the Campaign

At 9.30 one morning the campaign opened in earnest. The following was the method used in approaching prospects over the wire:

"Good morning Mrs. Jones. This is Miss Smith of the Blank Electric Light Company. To-day our Mr.— is demonstrating to the Model Housekeepers of our city, the wonderful A— Electric Cleaner, which no doubt, you have seen on display in our office. This afternoon our M.— will be in your neighborhood and we would very much appreciate it if you would allow him to call at your home and show you the merits of this electric cleaner. This demonstration will not cost you a cent, we simply ask you to give Mr.— your opinion as to the value of such a cleaner in your home."

This was the gist of the telephone conversation used by the operator. It resulted in a great many more home demonstrations than the company could take care of.

The machines were advertised to be sold, not on the partial payment plan, but on what we termed the "A— (name of cleaner)—Club Plan." Approximately 84 per cent of the machines sold were put on the "club plan," and 16 per cent were cash sales. \$2.50 was deducted from the list price for all cash sales. Also, of the 112 machines sold, 108 were sold complete, with all tools.

The girl operator was used for two weeks, then a man was tried. The girl secured the most telephone demonstrations. The company's men covered only about 4 of the 28 districts, the remaining number being covered by the men loaned to the city. Of course these men could work faster, being better acquainted with their sales subject.

The big success was due partly to the fact that the trial time was cut down to one day; the two men delivered the cleaner, and either sold it then or brought it right in. Five dollars was collected by the men upon delivery and the balance was charged on the bills, so much monthly. As said above, \$2.50 was added to the price for time payments. Cash sales averaged practically 20 per cent. The average time-payment price was \$47.50.

One of the salesman had an auto which was of great help in getting around. All the men took the cleaners along with them. Some salesmen dislike to go about the streets or in cars carrying a cleaner, but the wise business-getter knows that this very fact often opens up avenues of sales for him. When he sees the people are interested he doesn't hesitate to broach his sales subject to them.

Summary of the Campaign

An axiom developed by this campaign was that "the more prospects the salesman can see the more he will sell." It is all a matter of averages. Given so many live prospects, the average salesman can see about "so-many" in a day, making such-and-such a form of solicitation. If his solicitation or demonstration can be shortened, or if he can be made to reach more prospects in the same given time, then he is assured of a bigger business, because it is certain that under average conditions he can sell about such-and-such an average.

In the above campaign, the "club plan" embraced a broad and comprehensive guarantee by the manufacturer (who furnished a certificate with each machine sold) and a guarantee of satisfaction by the lighting company. There were few store sales. There were no store demonstrations, but this could easily have been arranged had conditions been considered favorable for it.

This campaign, it should be mentioned, was held in the middle of summer—a time of the year when it was considered that cleaners could never be sold by campaign methods, in quantity. But this goes to prove that cleaner selling is not a seasonable proposition. Electric cleaners can be sold in the dead of winter and the heat of summer just as well as in the spring and fall.

The company is following up the beforementioned campaign and expects to sell another 300 cleaners on the strength of the 112 already put out. It states that only about one-fifth of the territory has been canvassed.

Brief Resume of Plan of Action

1. Make certain of your make of cleaners (will the selling price appeal to the greatest majority of incomes in your city, etc.)
2. Get the manufacturers' co-operation and don't overlook the jobber—whichever you buy through.
3. Analyze your local market as to the possible number of cleaners sold, compared with number of resident-customers.

ers of the lighting company not possessing cleaners; also analyze local competition; who now sells cleaners, and how. Have there been any active cleaner campaigns. Would door-to-door canvass and solicitation be practical.

Estimate carefully (with the help of jobber of manufacturer) the number of cleaners that might be sold in the campaign, decide carefully on selling price (whether to sell at less-than-list or not, etc.) apportion the selling and advertising expense so that you know just "how much" out of every cleaner sale can be charged to advertising, to demonstration, etc.

5. Form the basic plan, whether to have a "club-plan" as above, or a "time-payment" plan, or "cash-discount" sale, etc. Whatever is decided, this should be the "feature," or drawing-card of the campaign.

6. Educate your entire organization on the campaign; let them know the plan, what their duties are, etc.—even if they are not to sell. The bookkeeper may be able to sell cleaners simply by being able to answer questions; the errand boy may lose you sales if he is not 'educated' as to just what the sale is, etc. should a customer come into the store, and nobody be present at the time to wait upon him.

7. Try to analyze in your city whether your appeal must be made mainly to men or women. An investigation of 793 dealers show that out of every hundred sales of cleaners 50 are bought by women, 22 by men, and 28 by both men and women. This investigation covered all sorts of dealers, department stores, specialty merchants, house-furnishing stores, and so on. It is true in some cases that the men buy, after being urged, even "nagged" by the women for them; in a few cases men buy outright, but this is not true of the lower priced machines, which are usually bought by the woman. On this basis, advertising appeal should be made to the man-of-the-house as well as the housewife. This can be done by mail, or in person. The man should not be overlooked.

8. Chart your prospects by districts, precincts, sections, blocks, or in such fashion that your outside people can make shortest work of solicitation. Map out these districts, carefully beforehand, and have it distinctly understood just which man is to cover the different territory.

9. Arrange for telephone solicitation (the Society has just prepared a short report on How to Get Business by Telephone). Be careful of the girl who does this telephoning, and particularly about what she says, and how she says it. A mature woman makes a better representative of your company than a girl, both as to telephone solicitation and demonstrations.

10. Get your store interior and window fixed up; have sufficient models on display to take care of all requirements (a campaign is not a campaign if there are not quantities of cleaners in the store, windows, and the place does not have the hustling appearance usually connected with stores carrying on campaigns).

11. Begin your campaign at a certain time, carry it on for a certain period (and advertise the time). Don't drag out the campaign for too long a time. Try to cover your territory quickly and intensively.

12. Advertise consistently, and frequently. Don't quit.

13. Don't overlook the possible help of the central station, or even a bank—any way to finance payments that will make it easy to pay is advisable. The more co-operation you get from other electrical interests the better. Don't worry if other dealers display and feature cleaners during your campaign; you can't stop their selling some goods through your own advertising. But don't consider them in your advertising or personal solicitation; never mention a competitor—never knock—never criticize. Play your own game, and play it hard.

14. Follow up your campaign. Try to place every cleaner

so that the customer will be glad to give you the names of friends to whom you can later sell cleaners. Beware of 'come-backs.' Follow up each installation within a prescribed time and see that the product is giving satisfaction.

Dalyte Electric, Limited

During the year 1911 Mr. J. S. Wheeler organized The Flexible Conduit Co., Limited, to manufacture flexible conduits which are used in electrical installations. This company was successful from the start, and the demand for its products increased so rapidly that they are now producing ten times the original output. Later, in 1914, he organized the Munder Tungsten Lamp Co., Limited, to manufacture tungsten lamps. The operations of this company have also been very successful and the production today is many times greater than at the start. Again in 1917 Mr. Wheeler organized the Dalyte Lamp Co., Limited, to manufacture nitrogen gas filled high efficiency lamps. These three companies were located in the same factory building, all under the management of Mr. Wheeler, with one office staff, and owned by one group of stockholders. Last December the stockholders of the three companies decided to amalgamate. The amalgamation is now completed. Dominion Charter has been granted under the name of Dalyte Electric Limited, with authorized capital of \$1,000,000.00.

The new company own the factory buildings and real estate in connection therewith, and are now installing equipment to again double the production in all departments. Sales offices have also been opened in all the principal cities in Canada. The new company is under the same management as the old companies, and the officers and directors were elected from the three groups of officers and directors of the old companies. Owing to the greatly increased manufacturing facilities, the new company will now be in a position to render much better service to their customers, as we understand the old companies have never been able to cope with the business offered them.

Put Your Capital in Live Merchandise

Sell the goods that sell. Stock and advertise the goods that will whet the public appetite. Study the needs and buying habits of your trade, and select those goods that they will buy without so much urging.

Merchandise that sells quickly, with a rapid turnover, no matter how small the gross profit, is a quicker money-maker than goods that afford a wider margin of profit but are slow-selling. Wide-awake merchandisers are learning that rapid turn-over means a corresponding low cost of doing business. It is the slow moving items, that require to be shown time and time again, which are the ones that pile up the selling costs.

Sell the goods that sell more easily.—Sales Service.

Now that the war is over, the Administrative Commissioners of the city of Montreal will request the Quebec Public Utilities Commissioners to compel the public utility companies to place their wires in the underground conduits of No. 4 and No. 6 districts. These districts comprise St. Lawrence Street from Craig to Sherbrooke Streets and Craig and Notre Dame Streets, from St. Lambert Hill to McGill Street. The Utilities Commission decided, in April last, that the companies be allowed to defer the work owing to the abnormal cost of materials and the difficulty of securing supplies, due to the war. The Commissioners postponed the work until conditions altered. The city now contend that this time has arrived, and that the city is entitled to get the benefit of the conduits.

Good Factory Lighting vs. Increased Production

By Mr. H. Leveridge*

The Department of Labor welcomes and appreciates this opportunity of discussing with your Association the provisions of the recently adopted Code of Lighting for factories, mills and other work places, and in my prepared remarks I have endeavored to cover the subject as thoroughly as limited time will permit.

During the past two decades the relation between employers and employees has materially changed. Previous to this time no special attention was paid to working conditions or effort made to insure the comfort of the employee. Labor gradually organized and demanded certain working conditions. These were at first grudgingly granted. Gradually, however, with a most intensive study of plant management, superintendents and others began to see that the mere economics of plant operations demanded improved laboring conditions. Efficiency began to be the watchword. It was overdone in some instances, for practically nothing else was heard for a number of years.

It was pointed out and clearly demonstrated that improved laboring conditions meant greater outputs for the same cost. This meant a greater return on the investment and both capital and labor benefited.

One of the features of these revolutionary changes was the Safety First Movement. Accidents are expensive and demoralizing. Investigation proved, beyond question of doubt, that the majority of industrial accidents were avoidable. Through the universal spreading of the Safety First Movement accidents have been greatly reduced. Many factors are contributory causes to accidents. The more advanced employers realize the ill effects of accidents and take due precaution in designing the equipment of their shops to make them safe.

On the other hand, many employers are possibly ignorant, ill informed or naturally thoughtless. They take no precautions of this nature. At this point, for the protection of its citizens, it is necessary that the State step in and put into effect certain mandatory rulings.

The statute books reveal legislation of many forms along this line. It is only recently, however, that the relation of lighting to accidents has been understood and recognized. Analysis of accident reports reveal that bad lighting is a contributory cause. Statistics show that many accidents are due to falls and to being caught or cut by moving machinery. It can be seen that the old scheme of placing a single lamp without a reflector immediately over the work causes many of these accidents. Such a system of illumination may give plenty of light on the work, but it does not give sufficient for the aisles and passageways or on the moving parts of the machinery such as the gears, where the actual work is not being carried on. Under conditions such as these, articles are often allowed to accumulate in the aisles resulting in falls. It is doubtful whether the foreman would have allowed these things to lie about if the passageways had been well lighted.

Furthermore, with such a system of lighting where the eyes are not shielded from the lamp, the workman is not able to see well when he turns away. Not seeing the fast moving gears or belts, he may come in contact with them and injury results. A system of general illumination for the entire room will greatly aid in overcoming these faults. Naturally, those interested in lighting, such as the engineers

and scientists comprising the membership of the Illuminating Engineering Society, were the first to recognize these relations. A committee on lighting legislation was formed which was composed of some of the foremost experts in industrial lighting of the country. They formulated a set of rules or specifications designed to aid State Legislators and departments of labor, who wished to prepare codes of lighting. This work was not done in a single sitting, but required months, even years of careful thought, discussion, accompanied by experimentation. Their next move was to get in touch with certain representative law making bodies and to offer their cooperation along the lines laid down.

Minimum Requirements Often Not Satisfactory

The requirements set forth in the code are not in the least exacting. The only factor concerning which a state can legislate is that of safety. Economic operating conditions actually demand far higher intensities than specified as minimum by the code. You should take every opportunity to point out to the factory men that compliance with the rules does not mean that they will have what we all consider good lighting. Maximum production demands far higher intensities. It is good business on their part to increase the intensities several fold over those specified as minimum, if they wish to get the greatest output for the minimum expenditure for labor.

It is not in our province to go into that question here, but very careful investigations reveal that good lighting does materially increase production. For example, it might be well to state one specific case now on record. It is true that there are many factors which effect production, and it is almost impossible to differentiate between them.

A number of tests have been proposed to determine the relation of light to output. In one conducted by the Commonwealth Edison Company of Chicago, in a machine shop, incandescent lamps in deep bowl reflectors were carefully designed to provide four foot candles of illumination at the work. The men worked under these conditions for a period. Then the intensity was increased to 12 foot candles, in other words, the lighting was trebled. This change was attended by an 8 to 27 per cent increase in production. These figures cover eight different operations which averaged a 15 per cent. increase. Every precaution was taken to insure fair results. That is really startling. An average increase of 15 per cent. in output as a result of an extremely small actual increase in operating expense. The amazing thing is that the initial intensity, four foot candles, is ordinarily considered good lighting. For example, in our code under intensity required, Class F, the foot candles, ordinary practice is stated for fine manufacturing, such as fine lathe work, pattern and tool making, light colored textiles, as four to eight foot candles, whereas our minimum requirement is only three foot candles.

I merely bring in this illustration to show how lenient the code is in its absolute requirements and how it is to the operating concern's advantage to not only meet the requirements of the code, but go far beyond them if they wish to get the greatest return on their investment.

So much for the historical side of the question. I have briefly outlined the origin, development and reason of the code. Let us now analyze the features attendant on its successful operation. I bespeak the heartiest co-operation on your part.

The success of any progressive humanitarian movement

*Chief of Electrical Equipment, Department of Labor of New Jersey—before Annual Meeting, New Jersey Association of Electrical Contractors and Dealers.

is largely dependent on the state of education of the people it affects. It is obviously impossible to enforce something which the public does not understand, at least in a general manner. The code of lighting can be enforced with minimum friction only after a campaign of education and publicity. You are the people in direct contact with the installation. You can sell poor lighting or you can sell good lighting. Through you the manufacturer can become informed on the requirements of the code, on the method of meeting these requirements and on the general advantages accruing from adequate artificial illumination systems.

The first step, therefore, is to become thoroughly familiar with the code yourselves, with its intent or purpose, with its requirements and with the means of meeting these requirements. Then you are in a position to preach the doctrine of better industrial lighting. Incidentally, this, of course, means money in your pocket.

It is safe to assume that the great majority of factories and workrooms do not satisfactorily comply with the essentials of good industrial lighting. There is a tremendous field for improvement. The large shops, in general, have trained engineers or men who have time to devote to the investigation of this subject. The manufacturer of lamps and reflectors can afford to spend some time in missionary work with a big plant, laying out the lighting system and otherwise selling good lighting. It is not economically feasible, however, for the manufacturer to go direct to the small shop. They attempt to do it through general publicity, it is true, but you gentlemen have the most at stake and should spend some time and effort in educational work with this group.

It is not necessary to be technical, in fact, the aim of everyone concerned when writing the code was to avoid technicalities and put the data in its simplest terms.

An Analysis of the Code

Let us now take up the code section by section and discuss the matter with the view to getting it thoroughly clear in our minds.

Rule 1 is merely a general statement to the effect that with diminishing day light or absence of daylight, artificial light must be supplied in all parts of a plant where work is carried on or where workmen are likely to be required to go in the course of their duties.

In rule 2 we have expressed the one definitely measurable feature of lighting, that is intensity. It is apparent to anyone who gives the matter a little thought that safety requires enough light to clearly see every dangerous object; that protection of the eye from undue strain requires that enough light fall on the work so that it can see the details of the work without severe strain or forcing of the ocular system. It is, therefore, perfectly logical to specify certain minimum intensities of illumination for different classes of service, not that the amount of light is the only governing feature which makes good lighting, but being something which we can determine, it is gone into in somewhat more detail than the other features. In many respects rule 3, covering glare, which we will take up later, is more important than intensity, but at the present state of the art, we have no instrument or means of measuring or specifying glare, and therefore have to content ourselves in this instance with a general statement.

There are a number of instruments, known as portable photometers, which enable us to measure the intensity or amount of light falling on an object. These instruments in general are simple in operation, quite accurate, although some types are more complex than others. The simplest type, although not the most accurate, is known as a foot candle meter. This instrument is small in size and self-contained; in fact it can be carried in the coat pocket and was

developed especially for this class of measurement. On the inside of the instrument is a flash light battery, a resistance coil and a voltmeter. This equipment supplies current to a small standardized lamp and regulates it to the correct voltage. The voltmeter is calibrated with a marking at which the needle must be set by means of the rheostat. When the pointer is at this mark, the instrument is direct reading. In other words, measures directly in foot candles. So much for the electrical equipment.

The light measuring portion consists of the lamp above mentioned enclosed in a little box. The light of this lamp is projected into a wedge shaped box, painted white on the inside. Obviously, the further end of this wedge will be less bright than the end near the lamp. The top of the wedge shaped box is covered with a sheet of rather heavy cardboard through which a series of small circular holes are punched. The cardboard, in turn, is covered with a thin tissue paper. What is the effect of this combination? These holes will appear of different degrees of brightness, depending on whether they are near or far from the lamp. Now suppose light from some external surface falls on this piece of tissue paper. It will illuminate it to a certain brightness. The holes near the standard lamp will probably be brighter than the rest of the screen or paper, while those away from the lamp will appear darker. Somewhere between, the hole and the surrounding paper will appear equally bright. In other words, the spot of light will practically disappear. This is then the point of balance. It is then only necessary to mark on this tissue paper a set of values indicating the foot candles at the point where the hole and the surrounding surface is equally bright.

The first step in the operation of the foot candle meter is to be set the voltmeter needle at the point marked on the scale. This should be checked frequently during the test to see that the voltage of the battery has not varied. The meter is then placed on the machine, desk, wall, floor or wherever it is desired to know the intensity of illumination and the reading taken.

Shadows Must be Considered

In measuring illumination intensities, the operator should bear in mind the fact that his shadow, if allowed to fall on the instrument, will affect the reading to a considerable extent. In general, unusual shadows should not be introduced and usual shadows such as those of a workman at his lathe should not be avoided, although of course the purpose of the test is the governing factor in this connection.

For example, if one desires to measure the illumination at a desk under working conditions, he would sit in the position ordinarily taken by the one who uses the desk, in order that shadows on the instrument and hence on the work, will be natural.

Rule 3 reads that lamps shall be suitably shaded to minimum glare. Strictly speaking from a safety and eye protecting standpoint, this is the most important rule of the code. On the other hand, as I mentioned before, it is impossible to measure glare or specify it definitely. Modern light sources are far too brilliant to be looked at for any length of time. Some means must be provided to protect the eye of the worker from this bright source. This protection may take the form of an opaque shield or of a diffusing medium which enlarges the apparent size of the source and so reduces its brightness; or lamps may be so placed that they do not come in the ordinary angle of view. Metal reflectors of proper design hiding the filament from direct view form the first class. Translucent glass reflectors or diffusing enclosing globes form the second class.

It would require much more time than is available now

to analyze every feature appertaining to glare. A few general hints must, therefore, suffice.

A reflector so small that the lamp projects away beyond its proper limits is obviously not suitable. The old style flat reflectors with no shielding effect are not adapted for use with the latest types of lamps. In general, it is well to hang lamps high. This is one of the best methods of eliminating the cause of glare. Hanging lamps high does not reduce the average intensity of illumination throughout the room, for the proper reflector can be chosen to bend or reflect the light rays in such a manner that the high hanging is compensated for with a more concentrated distribution of light from the reflecting equipment. Glaring reflections from the objects illuminated also must be avoided. For example, polished surfaces reflect the images of lamp filaments, etc., and this reflected light is almost as annoying as the direct light from the lamp itself. Under such conditions, special precautions should be taken in equipping the lamp so that this trouble is avoided.

There are a number of types of special lighting devices on the market which, although somewhat more expensive, practically eliminate this trouble.

The determination of the degree of satisfactory compliance with the law in regard to rule 3 will be at the present time largely a matter of experience and common sense. The experienced man with trained powers of observation can form a reasonably reliable opinion as to whether an installation is glaring and hence objectionable from this standpoint.

A similar statement applies to rule 4, which treats of the distribution of light on the work. One can see whether objectionable shadows are produced or whether there are sharp contrasts in intensity. For some work too diffused a light is not well suited and certain shadows are necessary, an instance of this being in the mould shop of a foundry where the contour and shape is determined largely by rather sharp shadows. For this very reason it is impractical to state in definite terms that the ratio of intensity between minimum and maximum light shall be of a certain value as determined by the reading with the foot candle meter. It is better to determine for one's self whether certain shadows are objectionable or not.

The Effect of Dirt Accumulations

Rules 5, 6 and 7 are practically self-explanatory, and not being directly connected with the lighting results are somewhat out of the province of my talk to-day. The appendix to the code has been quite carefully gotten up with the view to guiding practice so that it will meet the requirements and so that the non-technical man can improve his lighting without undue expense. The treatment on natural lighting is comprehensive and well worth careful consideration by every plant. Daylight is practically free to all intent and purposes and should be utilized to the greatest extent. One of the most important phases frequently overlooked in the utilization of daylight is treated on page 11 under dirt accumulations. I am quite safe in stating that in the great majority of factory buildings, windows do not receive the attention they deserve. Dirty windows do not only cause the plant to present a slovenly appearance and general untidiness, but they mean either a continual burning of lamps or turning on artificial lights at an earlier hour. Tests were recently conducted on the windows of an office building in the neighborhood of Newark, which had not been cleaned for some time, and which might be described as moderately dirty, and they were found to absorb 50 per cent of the light. Tests on some of the really dirty factory and shop windows indicate that the absorptions run well over 80 or 90 per cent. Bring up little points like this when discussing the matter

with the plant manager. Show them that you have a real interest in the successful operation of the establishment. In this way you will benefit the community as a whole and the good will gained will amply repay you for the effort expended.

In Section 2 of the Appendix a discussion is given on the value of adequate illumination. I have covered some of these in my introductory remarks. You, as contractors and salesmen of lighting installations, should study this section quite carefully as it will provide you with talking points of remarkable value.

Sections 5, 6 and 7 present hints as well as illustrations which will be of value in planning the new and improved lighting systems.

In Section 11 a brief statement is made as to the functions of a reflector. It is true that light could be produced by lamps without reflectors. Nevertheless, it would be utilized most ineffectively if reflectors were not provided to direct the light where required. I would not make as broad a statement as to say that every lamp throughout a plant needs a reflector, but I believe I am fairly safe in stating that at least 85 per cent. require them.

The Importance of Light Colored Surroundings

Brief mention is also made in this section of the desirability of light colored surroundings. Paint is a wonderful adjunct to the lighting system. It enables one to obtain the desired illumination with a minimum expenditure for energy. Increasing the co-efficient of reflection of the side walls and ceilings greatly improves the light on the work. An occasional coat of paint shows a big return in the reduction of the lighting bill. Mention such a fact as this to the man interested. If it is not apparent at once, get him to try it out in a single room and compare it with a similar room with the typical dingy surroundings. The comparison will be so striking that he will not hesitate long in adopting your suggestion, and this may be a powerful entering wedge for his business.

Some important suggestions are also given on the maintenance of a lighting system. If you sell a man a motor, you usually give him an instruction card telling him how to oil the motor, adjust the brushes and the like. If you did not do this and he did not attend to the matter through his own appreciation of the subject, the motor would soon stall, burn out, and you would be justly blamed. On the other hand, many a lighting installation is sold with no instructions or suggestions as to its maintenance. There is a generally prevalent opinion that after the lamp and reflector are hung up the lighting system will operate satisfactorily for an indefinite period, with the occasional replacement of a burned out or badly blackened lamp. This is not the case. A lighting system demands careful maintenance. If it does not receive it, soon the intensity will drop so low that the men cannot see to perform their work. You will get the blame. You will be told that the installation you designed and installed is not adequate for the purpose. Your engineering judgment will be criticised.

Lamps and reflectors should be carefully cleaned at regular intervals, as an imperceptible accumulation of dirt or dust materially reduces the output of light and hence the resultant illumination. Many an unsatisfactory lighting installation has been made entirely satisfactory by the simple expedient of a little elbow grease, soap and water.

The more modern systems of semi-indirect and totally indirect lighting are particularly susceptible to this accumulation and your well planned system will receive a bad black eye if it is allowed to be neglected. Force this point home and save future trouble.

How I Increased My Sales 100 Per Cent.

There was a period in my selling career when I was merely intent on selling electrical appliances. Indeed, I was so saturated with the idea of placing appliances in everybody's home that I grew impatient at the stupidity of customers who failed to become as enthusiastic as myself. It was evident that far too many people showed no interest whatever in these things.

Then I had an inspiration!

"All wrong," I said to myself. "You're barking up the wrong tree. Your chief aim in life may be to sell electrical appliances all right, but who cares about that? Nobody's going to buy an iron or a toaster or a vacuum cleaner or a range or a washing machine to ornament his home with. The man or woman working in a dim room doesn't want lamps—he wants **light**, and he really doesn't care whether you make it for him with a lamp or a broom-stick." And so, as I said, I had an inspiration. What the people want is not "appliances," but "service." They want to know what the appliance will **do**. The thing that does it and the price that thing costs is a secondary consideration.

So I set myself to forget that I had anything else to sell but "service."

And, the first discovery I made was that you can't sell "service" without samples—in other words you've got to **demonstrate**. It doesn't matter what you are handling, it's always the same. The housewife wants clean carpets—so I sell her clean carpets; or crisp toast, or better coffee—I sell her those things, without mentioning toaster or percolator. The interchange of the money for the article is a mere mechanical detail that follows as a matter of course. Sell the **idea** and you can't block the sale of the appliance however hard you try.

That reminds me of the way a friend of mine sells lighting and power plants. You know the usual way—get the farmer into your office where you have a plant or two all set up with an elaborate system of pipes and conduits, concrete foundation, elaborate control and so on, and then you try to explain all the various advantages, while the farmer's head grows dizzy. Not so with my friend. He bought a Ford motor truck, loaded one of his plants on it, covered it with a neat canvas dog-house and hied him out to the country—no, not early in the morning when everything about the farm was bright and gay, nor yet in the middle of the afternoon when the farmer was rushed off his feet, but—why, just as the evening was drawing in, of course, and the farmer was finishing his evening meal and calling for a lamp to read his paper. Then my friend showed his human side. He didn't talk "plant" to the farmer. He pulled out 100 feet of flexible cord, ran it into the house over the farmer's chair, started his engine and, ecco—the thing was done. Then he let the members of the family carry the light around to the various rooms, look into the many dark corners that they had never really had a chance of looking into before, feel the warmth and life of a really well-lighted home and waited for the pressure to buy that he knew would be exerted on the father.

That is what I call salesmanship, eh? That's the kind of thing that's going to place electrical appliances by thousands in the homes of consumers in the near future, if we only remember that our business is selling the **idea** of what electricity **does** for the human race.

That Campaign of Education

Mr. Frank T. Groome, sales manager Benjamin Electric Company, is vigorously pressing his campaign of education among the contractors of the province. Already he has addressed meetings in London, Toronto, Montreal, Hamilton, Kitchener and Brantford. Mr. Groome says his plan appeals to contractor-dealers and others particularly on account of the "efficiency" of the idea. If he can explain the use and properties of his devices in the space of an hour or so in the evening when the men are off duty anyway, he not only saves a lot of time for himself, but also saves good working daylight for everybody else. Further, it is practicable to make a demonstration before such a meeting much more complete than would be possible in a private office.

The meeting in Hamilton on the 19th was a splendid success. Mr. McIntyre was there too and explained the way the Toronto contractor-dealers are working together. He also told them about the open-price plan which is now in full operation among Toronto electrical contractors.

How Much to Spend for Advertising

Contractors and dealers often are puzzled to determine what percentage of their gross business to spend in advertising. There is no one fixed percentage that would be suitable for all to use; conditions as they exist in the particular concern's community and within that concern's business really control the matter.

A certain New York City contractor devotes 3½ per cent. of his gross business of a fraction over \$35,000 to cultivating his mailing list of about 600 names, and to maintaining an advertisement in the classified telephone book. Whereas, another contractor, in a Western city, who has a much smaller list, but more difficult competition to face, feels that he is justified in spending 8 per cent of his gross to get business.

For advertising a retail electric shop, from three to five per cent. of the gross business is considered by many dealers to be about right. Some large merchandising establishments where the gross volume is very considerable are able to advertise effectively even upon a smaller percentage.

If you are spending a fixed sum yearly, check that figure against your gross business and find out what the percentage is. Find out, too, if you can, what approximate amount your competitor spends. Check the growth of your business month by month against your advertising increase. In all probability you will find that as you increase your expenditure for advertising that your gross business increases also.—Monthly Sales Service.

New Commission Order

Manufacturers of cabinets and cut-out boxes have been advised by the Hydro-electric Power Commission of Ontario that on and after April 1, 1919, all cabinets and cut-out boxes offered for sale in Ontario must bear the approval label of the Commission. In lieu of this label, the label of the Underwriters' Laboratories may be accepted at the option of the Commission.

The death occurred recently of Mr. Herbert W. Kent, manager of the Northern Electric Company at Vancouver, B.C. Previous to going with the Northern Electric Company he had been for many years manager of the B. C. Telephone Company. His home town was Peterboro, Ont., where the remains were taken for interment.

Renfrew Electric Products, Limited, Renfrew, Ontario, have been granted a Dominion charter.

Current News and Notes

Barrie, Ont.

The annual statement of the Barrie electric light department for 1918 shows a gross surplus of \$8,371.19, which, after deducting a depreciation allowance of \$3,517, leaves a net surplus of \$4,854.19. Total earnings for the year were \$35,239.

Chatham, Ont.

The annual report of the Chatham Hydro-electric System for the year 1918 shows a total revenue of \$73,110—an increase of 36 per cent. over 1917. The total operating costs, including power purchased and all charges for debenture account and interest were \$66,647, leaving a surplus of \$6,634. Of this amount \$5,318 has been transferred to the depreciation reserve. In addition to the sale of current, the Commission carried on, without loss, a business amounting to \$42,387 in electrical appliances and wiring.

Collingwood, Ont.

The Bell Telephone Company, Collingwood branch, have moved into their new office building, corner Hurontario and Third streets. Modern equipment has replaced the old system.

Edmonds, B.C.

Officials at the plant of the Pacific Smelting Company's works at Edmonds, B.C., state that through electric smelting they are able to manufacture calcium carbide giving five per cent. higher gas yield than that manufactured under the older method. It is stated that plans are being drawn for a large and permanent plant for this company.

Halifax, N. S.

A number of municipalities and industries in the New Glasgow district are endeavoring to have the Government appoint a competent engineer to look into the question of cheaper power. This engineer would be asked to report on the feasibility of developing Hydro-electric power at Sheet Harbor, about 80 miles distant, and also to report on a plant for developing power from coal at some central point.

Hamilton, Ont.

The Hydro-radial by-law recently submitted to the ratepayers of Hamilton, Ont., carried by a majority of 2,637. The by-law also carried in Nelson township, but was defeated in Saltfleet township.

London, Ont.

The London & Port Stanley Railway Company will erect new station buildings at St. Thomas and Port Stanley to cost about \$12,000 each.

Montreal, Que.

Wireless telephones are being installed in the Montreal Board of Trade offices. These will enable brokers to communicate with Kingston, Ottawa, Three Rivers and Quebec.

Ottawa, Ont.

The ratepayers of Ottawa, Ont., recently voted in favor of taking over the street railway and application is being made to the Ontario Legislature for the necessary authority. Control of the railway will be vested in the Ottawa Hydro-electric Power Commission.

Perth, Ont.

The town council of Perth, Ont., have granted the Hydro-electric Commission amounts totalling \$60,000 for the completion of work in connection with changing over the local system to Hydro.

St. Thomas, Ont.

The city council of St. Thomas, Ont., will prepare a by-law for submission to the ratepayers, authorizing an ex-

penditure of approximately \$50,000 for improvements to the street railway. The changes recommended include \$7,000 for remodelling seven of the present street cars into "one-man" cars with single trucks; \$3,000 for five new equipments at \$600 each; the balance of the \$50,000 to be used for replacing the old rails on Talbot street with 80 pound rails; reconstructing the car barns; installing new overhead equipment, new frogs and switches where necessary; new uniforms for the men and other renovations. Figures are also being prepared, and a by-law may be submitted, authorizing a sufficient expenditure to cover the cost of extending the Elgin street line.

Stouffville, Ont.

It is proposed to submit a by-law to the ratepayers of Stouffville, Ont., on the question of introducing Hydro power and scrapping the present municipal power plant. This plant is operated by steam and since the coal shortage there has been much inconvenience caused by shutdowns.

Sydney, N.S.

The Cape Breton Electric Company, Limited, Sydney, N.S., have been granted a six-cent fare on their local lines and in each zone of the Glace Bay division.

Winnipeg, Man.

E. P. Rothwell, of Winnipeg, has been awarded the contract for wiring the C.P.R. station.

Toronto, Ont.

The annual report of the Toronto Hydro-electric System for the past year shows a gross revenue of \$2,353,443 made up as follows: Lighting, \$743,914; power, \$982,859; street lighting, \$300,594; Exhibition, \$15,748; current supply in bulk to other municipalities, \$245,856; income from other sources, \$64,472. The expenditures were: \$842,251, cost of current; \$661,361, cost of operation and management; and \$846,164, fixed charges, interest, and sinking fund, a total of \$2,231,776, showing a net profit in the year's operations of \$21,666. The assets of the system are valued at \$10,628,232, with gross liabilities of \$10,564,253, showing a surplus of assets totalling \$63,979.

Personals

Mr. Fred Thomson, of the Fred Thomson Co., Ltd., Montreal, is recovering from a severe attack of rheumatic fever.

Col. Geo. C. Royce, who has been spending a few weeks in the South, getting a much needed rest, has returned much benefited by the trip.

Mr. S. L. B. Lines, general manager of The Chamberlain and Hookham Meter Company, sailed for England on Monday, March 17th. He expects to be absent four or five weeks.

Mr. T. B. Macaulay, president and managing-director of the Sun Life Assurance Company of Canada, has been elected a director of the Montreal Light, Heat and Power Consolidated, to fill the vacancy caused by the death of Sir Rodolphe Forget.

Mr. Albert Schofield, of the Ferranti Electrical Company of Canada, has just returned from overseas. He was first stationed at Saloniki, but later was appointed an officer of the Royal Engineers, operating in France. Mr. Schofield's old friends in the trade will be glad to greet him when he calls on them as usual during the next few weeks.

Mr. Lawford Grant has resumed his former position as managing-director and treasurer of the Eugene F. Phillips Electrical Works, Limited, Montreal. The vacancy on the Board of Directors caused by the death of Mr. G. H. Olney has been filled by the appointment of Mr. A. J. Carroll. Mr. R. H. Balfour has been appointed assistant-treasurer, and Mr. A. Richards assistant-secretary.

Of All The Better Makes In America
EUREKA Vacuum Cleaners

Won The Grand Prize at Panama!

SELL EUREKAS

A household
necessity--NOT
A LUXURY.

Write us for prices, etc.

Eureka Vacuum Cleaners are the only Vacuum Cleaners judged by impartial experts to be 100 % EFFICIENT.

Constructed with one object only in view--TO GET THE DIRT.

Positively guaranteed to get the dirt when others fail--to be mechanically perfect--and to give better satisfaction in sales and service than any other vacuum cleaner.

Onward Manufacturing Co., Kitchener, Ontario

Linking your Lighting Business
to the Business of Building

Faith and true courage are about to be shown in the business of building--the vital business right now.

Your business--the business of lighting--is a vital part of every building. Link your business close to building, make it a power for progress and prosperity. You have in

Cora

The Glassware for
Efficient Lighting

a ready aid in substantial sales building. The uniform quality of "Cora" is the direct way to lighting efficiency and beauty--and lasting prestige for you.

For every lighting requirement where electricity is used there is a well adapted "Cora" Globe, Bowl, Reflector or Fixture.

The unit here illustrated is particularly suitable for the dining room. It gives soft concentration of light on the table, yet retains the full beauty of the semi-indirect bowl.

"Cora" Catalogue No. 45 is a book every Fixture Dealer needs. Just write for it to-day.

Advertisements for tenders, equipment, wanted or for sale, etc., or miscellaneous, are charged at \$2.80 per inch.

All advertisements must be in the publisher's hands by the 10th or 23rd of the month to insure insertion in the subsequent issue.

ELECTRICIAN, experienced in the operation of hydro-electric power plants and at present superintendent of plant, would like similar position. Apply Box 888, Electrical News, Toronto, Ont. 6-9

Induction Motors Wanted

One each 15, 25, 35, 50 H.P., 550 volt, 60 cycle, 2 phase. Would consider other voltages or three phase. State full particulars and best cash price. Address Box 843, Electrical News, Toronto, Ont. 3-t.f.

Small Transformers FOR SALE

A number of 600 watt and 1000 watt C. G. E. type H transformers for sale at very low prices. Guaranteed O.K. Pay for them after you try them out on your own lines.

Stormont Electric Light Co.,
Cornwall, Ont.
7-8

Prepayment Meters FOR SALE

60 Ferranti 5 and 10 amp., 110 volt, types B & C geared for 7 to 10 cent rate, in first-class condition. Will accept 55 per cent. present cost new meters. Address, Hydro-Electric Power Commission of Ontario, 190 University Avenue, Toronto. 7

Electrical Energy Control in England

Control of the generation and distribution of electricity throughout the United Kingdom is proposed by a bill now being prepared by the government. Authority over the electric supply, which is now vested in the Board of Trade and other government departments, would be transferred by the bill to a very small board, having probably only five members.

The United Kingdom would be divided into districts, the board members having in mind, first of all, the requirements of industrial sections. In each district a subsidiary board would be appointed to take direct charge.

All electric power stations would be purchased and placed in the hands of the local boards, each of which would be held responsible for the supply of electricity in its district, and for the establishment of new generating stations and transmission systems.

If private companies wish to enter the

For Sale

1-150 H.P. Corliss Steam Engine, made by Cowan & Co., Galt, Ont. Girder frame, left hand drive, side crank, 13' x 26" fly wheel.

Will sell at a bargain.

Full particulars on application to

Hydro Electric Commission,

5-t.f. of St. Thomas, Ont.

electric business, they would be compelled to buy their current from the local board and their earnings would be under control.

It is suggested that the local boards would only meet expenses and pay no profits. The financing of the plan would be in the hands of the government, except where it is practicable and advisable to finance the plan locally.

This plan is brought forward as a compromise between public and private control. The report upon which the bill is based was made by a committee which conducted a careful investigation. It points out that the electric system of the country is inadequate and recommends the adoption of a plan which will meet the requirements.

Importance of Industrial Heating Load

In an address before a recent meeting of the new-business men of the Ohio Electric Light Association, Mr. Wirt S. Scott, of the Westinghouse Electric and Manufacturing Company, stated that with the same energy devoted to the development of the industrial heating load that was given in the development of the motor load, greater progress can be made in less time. Mr. Scott said in part:

"The industrial heating load is so diversified that it is possible to find a load

which will fit in any valley of any power curve. Even the noon-hour off-peak period can be utilized for some specific operation which can be done at that time just as well as it can at some other period of the day.

"Many cases have come to our attention recently where the customer who was willing to electrify and had been turned down by the central station on account of the overload condition of the power plant during the day-time jumped at the chance to operate at night. In every case it had not occurred to the customer that the central station possibly could perform his particular heating operation at night just as well as during the day, and at much less expense, since the fixed charge for the power in many cases was taken care of by the day load, the night load being therefore obtained by the central station on a straight energy-cost basis.

"In the development of the motor load it was necessary for the central station to have specially trained men who could talk intelligently to the prospective customers and who had sufficient knowledge of motor application work to be able to secure the necessary data, so that either by their own knowledge or through a source of information they knew to be available, either in their own organization or in that of an electrical manufacturing company, the salesman could go back to the customers with the correct answer. Just as this was true of motor application work, so it is true of industrial heating.

"In order to develop the industrial heating load a vast amount of missionary work must be done, and the sooner these initial stages are passed just that much sooner will the central stations begin to reap the benefit of their efforts."—N.E.L.A. Bulletin.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

Are You Still Wasting Time and Money with Blow Torch and Solder?

not to mention alcohol, rubber, acid, tape and paste,—all of which combine to make the old method of connecting wires laborious, wasteful and expensive.

Get rid of it all and use the

WALGER INSULATED WIRE CONNECTOR

It is as simple as A.B.C. Your wireman, with merely a screwdriver and a dozen Walger connectors in his pocket, can make that many connections in the time that it takes the old method to make two or three. It's a thorough joint, too, and done without spoiling anyone's wall, ceiling, fixture or carpet.

Approved by Underwriters' Laboratories, Chicago, and Hydro-Electric Power Commission, Ontario, Canada, for No. 1 wire and under. Ask your Jobber for prices and discounts or write.

Trade Mark

Telephone Insulator

Height 2 1/2 inches, diameter 1 1/2 inches
with two 1/4 inch wire grooves.

The galvanized lag screw,
which is securely cement-
ed into the insulator, is flat-
tened just below the in-
sulator for engaging a
wrench.

Especially adapted for use
in mines, and for rural lines,
general service lines etc.

BUYERS AND SELLERS OF
NEW AND USED MACHINERY

A Continent-wide Service

The ECONOMY is the pioneer that opened up the renewable fuse field. This is the fuse with the incomparable renewal element—the "Drop Out" Link.

An inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency. It does away with the need of powdered filler. Even a novice can replace the link and renew the fuse in a jiffy.

ECONOMY renewable FUSES and "Drop Out" Renewal Links

are used in thousands of plants, large and small, representing all branches of industry. Their efficiency and economy have been proved over and over. They are uniformly accurate in rating. As compared with the use of one-time fuses, they cut annual fuse maintenance costs 80 per cent.

In the course of a year the average plant runs up a considerable bill on fuses. The economy effected by the Economy Fuse is worthy of your notice. A comparative fuse test will quickly convince you of this, as it has innumerable others.

Westinghouse

Electric Fans

12 in. Desk and Bracket Fan

The beauty of finish and striking appearance of Westinghouse Fans, single them out anywhere.

The drawn-steel frame construction permits a satin-like finish, that is one of their distinguishing features.

Given an oiling once a season, they run for years without further attention.

16 in. Desk and Bracket Fan

The line includes fans for the home, office, factory, restaurant, hotel, theatre, in short for every place a fan is used, and includes oscillating and non-oscillating desk and bracket fans; ceiling and gyrating fans; exhaust fans and blowers.

**This SOLENOID SWITCH has been adopted
by the Hydro Electric Commission
They use it for
STREET LIGHTING**

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

*We extend a cordial invitation to the electrical fraternity
 to call upon us in our new building—the largest and best equipped
 electrical repair establishment in Canada.*

HAVE you considered the G & W POTHEAD IDEA in your plans for improvements and expansion of your distribution system?

If not you are neglecting something that will save you money—money in equipment and installation costs—money which might be lost from service interruptions. And what is of even greater importance, you are neglecting features which will provide a maximum of flexibility in your distribution system,

making load shifting, future extensions, or quick changeovers easily accomplished if the occasion demands—and without cable cutting or "temporary work."

That is in general what the G & W Distribution Idea has accomplished for some of the largest Central Stations in the country—and it can do the same for you.

The Disconnecting Pothead and its various outgrowths are responsible for the soundness and reliability of the G & W Distribution Idea. In addition to being a dependable, moisture proof cable seal, the Disconnecting Pot Head is a simple and serviceable sectionalizer which does away with the need of a switch—all for the price of an ordinary cable seal. This feature in itself is worthy of consideration—not to speak of many other convincing advantages of the G & W Idea.

Have you received new Catalog No. 10? Contains Valuable illustrations and drawings for every Central Station Engineer

Electrical News

Generation, Transmission and Application of Electricity

Weston, Mass., October 16th 1918

Mr. P. F. Harrington
c/o Wagner Electric Manufacturing Co.
88 Brookline Avenue
Boston, Mass.

Dear Sir:

It gives me great pleasure to advise that we have a five horse power Wagner Electric Motor (Serial #12) which has been in constant use driving a water service pump on the C. W. Hubbard Farm at Weston, Mass., for about twenty-five years.

During the whole of this time the motor has given very satisfactory service and is today running just as good as ever. I might say that during the whole time mentioned the only expense in up-keep or maintenance has been for new brushes, re-surfacing and cleaning the commutators.

Yours very truly,

Joseph W. Paulson
Superintendent

12/25

Quality First

NATIONAL TROLLEY GUARD

The Ounce of Prevention

A grade crossing is a most likely and the most dangerous place for the trolley to jump. There is no "cure" for grade crossing accidents after they have happened. But National Trolley Guard will prevent a car stalling on the track due to a wild trolley.

It is a trough made of wire mesh and inverted over the trolley wire. When the wheel jumps it runs on the guard which furnishes power to carry the car to safety.

National Guard is far less expensive than its protection warrants. Send for data.

THE OHIO BRASS COMPANY, Mansfield, Ohio

NATIONAL PRODUCTS

SHERARDIZED

SHERARDUCT

The Rigid Steel Conduit with both surfaces Sherardized and Enameled. Rust Proof and Acid Proof. Made of a high grade spellerized mild steel tubing.

Write for Bulletin 50

ECONOMY BLACK ENAMELED

ECONOMY Black Enameled Conduit is made of the same high grade spellerized mild steel tubing as **SHERARDUCT**, the only difference being in the protective coating. In an enameled conduit there's none better.

Write for Bulletin 50

FLEXTUBE

Interwoven — Seamless — Non-Collapsible. Inseparable and Double Compounded. Easy to fish and every foot of every coil can be used

Write for Bulletin 151

FLEXTUBE

We cannot tell you *all* about *all* National Products in this limited space, but we want to call your especial attention to certain features of **FLEXTUBE** Double compounded, Non-Metallic Flexible Conduit.

It's the original seamless interwoven non-collapsible, non-metallic flexible conduit with the "roller-bearing" interior. There's absolutely no waste; every foot of every coil can be used, and it's so easy to fish that it's a pleasure for the wiremen to use it. That makes it profitable for the contractor, and its quality is such that the best interests of the owner are served. Note the construction. The seamless interwoven tubing compounded; then the protecting outer braid, also compounded—a double compounded tubing which is satisfying to those who insist upon the highest quality. Place your order for your requirements with your jobber; specify by name—**FLEXTUBE**.

The Meter of Merit

Write to us—the manufacturers—to-day for particulars.

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

C.G.E. Fans

Refreshing as a Summer Shower

Last year this Company paid out in wages over five million dollars. This large sum paid to Canadian work-people was spent in our own country and thereby every class of the community was benefited to a greater or lesser extent. It costs no more, and often much less to buy Canadian made goods, and in that manner keep Canadian money circulating in our own country instead of sending it abroad for the benefit of labor in a foreign country.

100%

efficient—that's what C. G. E. electric fans are.

The fans you sold in the past—are they giving your customers 100% satisfaction? They are if they were C. G. E. fans.

C. G. E. electric fans are the best selling fans on the market. Built for service, designed to give maximum draught at minimum cost.

We give 100% efficient dealer service—and supply free advertising matter of every description.

Ask our nearest sales office for 1919 Fan Campaign Literature. We maintain fully equipped branches from coast to coast.

"STANDARD WIRING"

TELLS YOU HOW

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or A. C. single, two or three-phase.

OUTSIDE—Line construction, line wires, service wires, poles and their dimensions and Insulators, guard arms, guy wires, how to install Lightning arrest-

weights, and how to erect and protect them and anchors. Tree wiring, splicing, service and wires. Transformers with diagrams and instructions.

INSIDE WIRING—When and where to wire. How to find the proper size of wire for current, voltage and drop, either by formulae or by the tables of the book. How to wire for two-phase and three-phase with formulae and tables in a simple manner that anyone can understand through partitions and walls and around roundings exist. When and how to do it. How to take. The proper way to install Outlet, Junction and Switch. How to complete interior conduits. Concealed knob and tube electric and combination electric and combination to use it. How to install.

LIGHT AND ILLUMINATION—The latest data on Mazda and other lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

A
Copy!

This is a handy pocket-size catalog illustrating our new range of popular-priced Electric Lighting Fixtures.

These fixtures are a medium grade line which have the artistic appearance of more costly goods—fixtures that have a big and constant sale among working and middle-class people who want an attractive fixture, yet with whom price is a very important consideration.

Each fixture is labelled with the Banfield trade-mark, symbolizing standardized quality and design, and signifying also that we stand behind them with a guarantee of their good value.

Always in Stock

You can rely on always being able to get delivery of Banfield Lighting Fixtures. The range, while not over large, is complete with all the styles that are in constant demand. And we carry a big stock at all times. By ordering Banfield Fixtures you avoid loss through delay and need never disappoint a customer. Each fixture is individually boxed, which preserves the finish and makes for ease of handling and neat stock-keeping.

Moreover, our discounts allow you to fix a price that gives you a good profit. Write for this catalog to-day.

A Recommendation which Safeguards The Power Company's Good Will

The Central Station Power Salesman who has had experience with R&M Motors recommends them to his prospective customers because he knows they will make good every claim he makes for electric drive. Their unfailing reliability, low maintenance cost and long life build a permanent good will for both the motors and the central station which supplies the power.

And with such good will the salesman knows he can count on the continued patronage of the customer and the

kind of co-operation which will enable him to get new business from other prospective customers.

The electrical dealer also finds added profit in R&M Reliability. The co-operation which it insures him from the central station makes his sales work easier, and the record of the motors in service makes repeat orders sure from every user.

The R&M Line includes D. C. Motors in sizes from 1/40 to 15 H.P. inclusive and A.C. in sizes from 1/40 to 50 H.P. inclusive.

No. 8

Organization Perfected to Promote the Use of Electric Furnaces

Important steps were taken to promote the use of various electric furnace products, at a meeting called by Mr. Acheson Smith, vice-president and general manager of the Acheson Graphite Company, held at Niagara Falls, N. Y., on Friday and Saturday, March 21 and 22. Mr. Smith made a general statement of the importance of getting before the consumers of electric furnace products, and the public generally, the many great advantages of the use of electric furnaces, and the uniformly high grade products which are made by them. He asserted that it was his belief that all interested in the matter could join together on a common basis to extend the use of electric furnaces and their quality products. A special emphasis was laid on electric steel, the tonnage of which during the past four years has shown a remarkable increase throughout the world. This has been brought about for two important reasons, (1) the higher quality which can be made by use of the electric furnace, (2) and the lower cost of operation shown in most cases as compared with the previous method of manufacture. The meeting passed resolutions inviting all manufacturers of electric furnaces, electrical apparatus, electric furnace supplies and accessories, public utility corporations, designers and inventors of electric furnace equipment, and the users of electric furnaces to become members and to join in making an aggressive and thorough campaign to disseminate to engineers and to the public accurate data as to the quality of electric furnace products

of all kinds. A splendid start was made in an organized way to carry out these plans. The meeting was attended by representatives of a large number of companies representing manufacturers of electric furnace equipment, accessories, utilities, supplies, designers and inventors, and manufacturers of electric steel. A permanent organization, to be called the Electric Furnace Association, was created, with Mr. Acheson Smith, Acheson Graphite Co., Niagara Falls, as president, and M. C. G. Schluederberg, Westinghouse Electric Mfg. Co., Pittsburgh, secretary.

The president was authorized to get in touch with all companies and persons who should be interested in joining the organization, and was requested to arrange an early meeting when completed publicity plans could be presented and thoroughly discussed. In the meantime the different committees were instructed to make every effort to rapidly perfect reports which could serve as a basis for constructive work. It is quite likely that the next meeting will be held in New York City the early part of April, at the same time as the Spring meeting of the American Electro-Chemical Society.

The Evolution of the Telegraph

Mr. C. E. Davies, tariff superintendent of the G. N. W. Telegraph Co., Toronto, spoke on the "Evolution of the Telegraph" at the Montreal Electrical Luncheon on March 26th. After a brief historical sketch of the invention of the telegraph, Mr. Davies referred to the use of the automatic apparatus, and its extensive adoption during the last five years. The G. N. W. now had 24 automatic sets for 17 circuits, handling 50 per cent of the 24 hour load. In Montreal 72 per cent of the entire traffic was dealt with by the automatic machines; 250 messages could be sent and received during an hour if conditions were favorable. On the Multiplex page Morkrum machines 800 messages per hour had been delivered. Automatic machines were more efficient from the point of view of errors and less costly to operate. Mr. Davies mentioned that in the early days the operators used to take the messages by ear instead of reading them from the tape—this was against orders, which showed that sometimes the operators had a sense of greater efficiency than the officers. There had been many inventions with a view of perfecting the automatic machines, but experience showed that the polar-duplex principle was the only one that had been successful. Of the 600 automatic machines invented, about six were in use today.

Mr. Davies then explained by a number of slides the principle on which the Morkrum machine operates and also the technical principles underlying the sending and receiving of multiplex messages. The final slides, showing the great damage done to lines by storms, was to explain the reasons, as Mr. Davies put it, "you sometimes do not receive your messages promptly."

The Luncheon passed a resolution favoring the Bill for daylight saving.

Toronto Section A. I. E. E.

The April 4 meeting of the Toronto section of the American Institute of Electrical Engineers though not of a specially technical nature was nevertheless full of personal interest for the record attendance which gathered to hear Mr. George D. Leacock in his "reminiscences" on the good old days when electric light plants were novelties and the 16 candlepower lamp a seven days' wonder. A meeting was also held on April 11—the long delayed Hamilton meeting—when Mr. G. E. Stoltz, of the Westinghouse Electric & Mfg. Com-

pany, East Pittsburgh, addressed the members on "Steel Mill Electrification."

The annual meeting will be held in the Engineers' Club, 96 King St. West, Toronto, on Friday evening, April 25. Mr. W. B. Buchanan, of the Ontario Hydro Laboratories, will deliver an address on "Some Overload Limitations of Current Transformers." The election of officers will follow, nominations for which have been received as follows:

Chairman, Ashton B. Cooper, Canadian General Electric Company.

Secretary, Daniel M. Fraser, Canadian General Electric Company.

Executive, L. B. Crubbuck,* Canadian Westinghouse Company; C. C. Clark, Swedish General Electric Company; H. C. Don Carlos, Ontario Hydro-electric Power Commission; F. R. Ewart, Ewart & Jacob; C. Sisson,* Canadian General Electric Company; W. Volkman, Toronto Power Co.

*Out of town members.

J. C. T. O. Representatives

The following representatives have been elected to the executive of the Joint Committee of Technical Organizations for the year 1919-20:

Jas. McEvoy, Can. Mining Institute, Toronto Br.; H. G. Acres, Engineering Institute of Canada, Toronto Branch; R. R. Grant, Association of Ontario Land Surveyors; D. E. Beynon, Society of Chemical Industry, Canadian Society; W. P. Dobson, Engineering Alumni Association, University of Toronto; T. U. Fairlie, Engineering Alumni Association, Queen's University; J. B. Carswell, Engineers Club; Harry Jewell, Royal Canadian Institute; J. E. Walsh, Canadian Manufacturers' Association; Maj. L. L. Anthes, Canadian Engineers, Mil. Dis. No. 2; C. B. Hamilton, Jr., American Society of Mechanical Engineers, Ontario Section; F. R. Ewart, American Institute of Electrical Engineers, Toronto Section; E. V. Pannell, Institution of Electrical Engineers; R. K. Shepard, Ontario Association of Architects; elected members, G. A. McCarthy, W. A. Bucke, secretary, Major R. D. Galbraith; treasurer, R. R. Grant. The chairman is Mr. Wills MacLachlan.

Ontario Hydro Further Reductions in Rates

The Hydro-electric Power Commission of Ontario have announced the following reductions in rates to various municipalities. This will doubtless result in reduced rates to the ultimate consumers, but these latter have not yet been determined. It will be noticed that the figures range as low as \$15.00 per horsepower:

Municipality.	Power	
	Present Rate	New Rate
Port Credit	\$27.00 per h.p.	\$25.00 per h.p.
Weston	30.00	25.00
Mimico	27.00	25.00

Power on the Nelson River

The Nelson River is of first importance, forming the outlet of one of the main drainage systems of the continent. The territory tributary to this river has a very wide range in physical features. It varies between the rugged and mountainous country of the Continental divide and the flat low-lying swamp area of the lower Saskatchewan. The variation in vegetable cover is great, large area being covered by dense forest growth, as compared with the open stretches of the western prairies. In the south-western part of the drainage area the soil cover is deep and few lakes are to be found, while in the eastern and northern sections the soil is generally thin, the rock is largely exposed, and many lakes are scattered throughout the territory.

The immediate source of the Nelson River is Lake Winnipeg, which acts as a collecting basin for greatest part of the drainage area. It forms one of the largest fresh water bodies on the continent, with a surface area of 9,414 square miles. The principal rivers draining into the lake are the Saskatchewan, Dauphin, Red and Winnipeg.

The total drainage area of the Nelson River is 450,000 square miles. With such a large area the run-off may be expected to be large. The length of the river is approximately 450 miles, and in this distance the total fall is 715.00 feet. The greater part of this fall is concentrated at the numerous falls and rapids which occur throughout the length of the river, and it is this feature, coupled with the large discharge, that makes the Nelson River so important from a power producing standpoint.

In the upper reaches the Nelson River is made up of a number of lake-like expanses connected by short stretches of river which are generally broken by rapids and falls. Between Sepiwick and Split Lake is a large stretch of river free from islands and interrupted by very few rapids. Below Split Lake numerous islands are encountered and the rapids

and falls are numerous. Rock outcrops are in evidence at practically all the rapids. The banks are generally higher in the lower reaches and the rock is covered with a greater overburden of clay. The river is navigable by small boats between the rapids, but except at the upper and lower ends the reaches open to uninterrupted navigation are short. The Hudson's Bay Railway crosses the river at two points, Manitou and Kettle Rapids. Above and below these points the railway is never at a great distance from the river, hence access to it at various points is comparatively easy. In the event of power development at any point only very short spur lines would be required.

No systematic surveys have been made to determine possible points at which the fall in the river might be concentrated, but from various observations the height of the falls has been very closely ascertained. On this account it is necessary in discussing the probable power output of the river to base the estimates on the fall at the various rapids and falls without any reference to the best method in which the whole fall might be utilized.

Regarding the discharge of the river more definite information is available. Estimates of daily discharge, based upon measurements made at Shell Rapids by officers of the Manitoba Hydrometric Survey and observed gauge heights at Norway House are available for a term of years. These indicate what may be expected as a probable minimum flow, also, the probable regulated discharge by developing storage on Lake Winnipeg.

Lake Winnipeg offers splendid opportunity for the development of storage, as very little range in lake level (from one foot to two feet) would provide for almost complete regulation of the Nelson River. This undertaking would involve considerable expenditure, but will be quite feasible economically when any considerable developments of the water powers on the river has been accomplished.

From the records referred to the following figures relating to discharge of the Nelson River have been prepared:

Ordinary minimum flow	50,000 c.f.s.
Estimated flow for maximum development . . .	80,800 c.f.s.
Dependable flow with storage	75,000 c.f.s.
Maximum recorded flow (Norway House)	122,000 c.f.s.
Minimum recorded flow (Norway House)	42,750 c.f.s.

From these figures it will be seen that the natural regulation is good, the variation between maximum and minimum flow being small, which is a much desired feature where hydraulic developments are concerned.

Regarding the head available at the various rapids and falls, this can only be finally determined by careful surveys, but the natural drop varies from 10 to 50 feet; they are, therefore, all low head propositions. This disadvantage is largely offset by the magnitude and small variation of the flow. The developments would all be large undertakings, but the opinion is ventured that the capital cost per horse power developed will compare very favorably with similar undertakings on this continent. As a measure of the size of any development the amount of power available per foot of head calculated at 80 per cent efficiency for "ordinary minimum flow," "estimated available for maximum development," and "dependable flow with storage," is 4,454, 7,345 and 6,817 h.p. respectively.

Available information indicates that 538 feet, out of a total fall of 715, may be developed at various points. Detailed surveys which must ultimately be made may decrease or increase this amount. In the aggregate the power that may be developed on the Nelson runs into very large figures. With the possible exception of the Columbia River, it has the greatest amount of potential power capable of development of any river on the continent. Upon the basis noted before the corresponding figures are 2,445,000, 3,952,000 and 3,668,000 h.p. respectively.—Manitoba's Northland.

University Training for Engineers

"I must go on to speak of the demand for first-class engineers. It is a very small demand at the best, but to fill that small demand is one of the most important tasks of American teachers and universities, because democracy does not lead only to raising the level, improving the capacity of the average man, but should lead to the development and profitable employment of men of superior ability in all sorts of human service. James Russell Lowell pointed out many years ago that unless democracy developed and set to work the highest types of human intelligence and character it would be a failure.

"I believe that to be a statement of absolute truth, gentlemen, not sufficiently understood and appreciated by the mass of educated Americans. The test of our form of government is going to be its capacity to develop scholars, research men, students and practical geniuses of the highest type. How is that to be accomplished?

"Does not the selection for the super-engineer or the super-statesman or the super-lawyer work well in this country—indeed, work quite as well as in any country—with this added advantage, that democratic society being plastic, not crystallized in layers as is society in some other countries, some of which are very impermeable, it results that throughout society, from bottom to top, there is a plasticity, a condition of yielding, with the natural impulse for talent to rise to all layers of society? That I believe to be one of the chief advantages of democratic society. It gives a man who has natural genius and superior talent a chance to go to the top. We had a wonderful case of that in Abraham Lincoln. It was because of democratic society and the opportunities which it offered that Abraham Lincoln attained his immortal vein.

"So I believe that these supermen whom we all want to bring forth in our democratic society will be brought forth, at any rate in many instances, and put in their proper places, and it is the first duty of our advanced institutions of education to provide for them every possible chance.

"What is the motive that, after all, must inspire these young men who are to become what we call here to-night the supermen? It is the scientific motive, gentlemen, the love of the occupation itself, and the satisfaction with their station in life which gives them the chance to devote themselves absolutely to the pursuit or the work that they love. Is not that the way in which all geniuses of the world have found their place? Is it not the way, in the future, that this country will be supplied with the men who are, after all, the leaders of all our progress in all our fields of endeavor and opportunity, exploitive of natural resources and exploitive of the human imagination?

"Now, gentlemen, the way to get for the service of the country these supermen is, I think, first utterly to change from the bottom to top the methods of instruction now used in the elementary and secondary schools and the colleges of the country. We never can get through our free schools the boys we want and the girls we want until the methods of instruction in the elementary and secondary schools are changed."—President Emeritus Eliot, Harvard University, before A.I.E.E.

An effort is being made by the Ottawa city council to acquire the light and gas plants of the Ottawa Light, Heat and Power Company. It is anticipated that the linking of the private company with the Hydro would be greatly beneficial to the city, although, at this writing, there is no indication that the company is prepared to sell.

Electric Equipment in Blooming Mill of Steel Company of Canada, Hamilton

The Electric Club of Toronto at their luncheon on Friday, March 21st, were favored with an interesting address by Mr. E. S. Jefferies, electrical engineer of the Steel Co. of Canada, Ltd., describing the company's blooming mill at their Hamilton plant. Before introducing his subject proper, Mr. Jefferies mentioned a new and amazing development in telephone work which had come to his notice. He had recently paid a visit to the laboratory of the American Telegraph & Telephone Co., which is in charge of Dr. Jewitt, who recently gave the Club a talk on the wireless telephone, and here he had seen a telephone device which transmitted the human voice without the use of mouthpiece, receiver, magnets, wire or batteries. This seemed almost incredible, but it was accomplished by the use of Epsom salts. He had actually heard a ground crystal of magnesium sulphate reproduce human speech, without batteries or any of the usual telephone equipment.

Mr. Jefferies had some interesting information to give on the use of electricity in the steel industries. He said that within the last ten years steel plants have adopted electric motors in nearly every motion in the mills and within the last four or five years for the driving of the main rolls where very large powered motors are required.

One factor tending to increase the motor application is the use of central station power instead of installing individual power stations. As an illustration of this point take the district around Canton, Ohio, where there are quite a number of mills taking power from one company. Hamilton and Toronto are also ideal examples of this, in that all the factories in these neighborhoods purchase power from two companies.

The United States Bureau of Census for 1912 gives the average kw.h. power generated in 1260 companies controlling the electric railways of the United States as four million eight hundred thousand kw.h. per company. Similar data for 5,221 electrical central stations including railway and lighting shows an average kw.h. generation of two million two hundred and two thousand per station. The foregoing compares with an average generation of nine million kw.h.

for each of the 225 plants (approximately) engaged in the iron and steel industry in the United States.

To give some idea of the growth of the steel industries for the period of 1906 to 1916, it is interesting to note the tonnage produced and the horse power of the motors installed. In 1906 there was produced in the United States, 19 million tons of steel ingots, and during that year an averaged installation of 15 thousand h.p. in motors, whereas in 1916 there was approximately 39 million tons of steel ingots made and a installation of 118 thousand h.p., showing an increase of approximately 205 per cent in tonnage and 785 per cent increase in the rate of motor h.p. applied. These figures certainly are significant in that they show the tremendous rate of increase by the use of electricity in the making of iron and steel.

Coming to the actual description of the mill, Mr. Jefferies illustrated the equipment with a number of slides. He pointed out that when the steel is poured from the open hearth furnace it is in the form of ingots, 5 ft. long, 17 in. square at the top, and weighing about 4,200 lbs. In the process of rolling, the ingot is reduced to a cross-section of 4-in. square, and is elongated to about 70 ft. This is accomplished by passing it back and forth between heavy rolls. At the beginning, the metal being short, the rolls have to reverse at great speed, and a large amount of power is required—is high as 7,000 h.p. for one second—while as the ingot lengthens, the reversal is slower, the speed is greater, and at the same time considerably less power is required; at the end of the operation 800 h.p. being used for a space of several seconds. The equipment used by the company is the Ilgner type. The set consists of a fly-wheel motor-generator set, slip regulator, and exciter, a reversing motor, and control apparatus. The motor generator set consists of an 1,800 h.p., 2,200 volt, 3 phase wound rotor induction motor; a 50-ton fly-wheel and two 1,200-kw., 600-volt d.c. generators, all mounted on a common shaft. The slip regulator or water rheostat, is operated by a torque motor, the current for which is delivered from a current transformer located in the main leads to the motor. The exciter is of 175-kw., 250 volt capacity and supplies all

General view of Ilgner Set, Electric Rolling Mill, Steel Company of Canada, Limited, Hamilton, Ont.

current for the motor and generator fields. The mill motor is a shunt-wound inter-pole motor, two units on one shaft, rated at 3,000 h.p. (continuous) and capable of delivering momentary peaks of 9,000 h.p. The control consists of a vertically operated drum-type controller about the size of a street car controller, which operates shunt contactors. These shunt contactors control the direction and speed of the mill motor by changing the polarity and varying the resistance of the field circuit of the variable voltage generators. In order to prevent the motor from being over-loaded, a current relay placed in the main leads of the mill motor operates on overload and introduces resistance in the field circuit, thereby decreasing the field strength and generator voltage, which in turn limits the torque. The motor fields are excited constantly in one direction, but for speeding the motor for long passes, series resistance is introduced.

Characteristics of the System

Mr. Jefferies next showed a number of curves illustrating the characteristics of the system—the kilowatt input to motor generator set, the variations in speed of the motor generator set, speed and direction of the mill motor, input of the mill motor etc. These curves, while not an average of observation, were typical curves taken simultaneously, and illustrated the action of the slip regulator and fly-wheel in minimizing the fluctuations in power demand. In this case the maximum input is about 1200 kw., the speed of the fly-wheel varying between 490 maximum and 435 minimum, whereas the load on the mill ran as high as 3,000 kw. As the

Main Roll (Reversing) Motor, 3,000 h.p. continuous capacity

rotative energy of the fly-wheel is proportional to the square of the speed at which it is turning, a reduction of 15 per cent in speed means that 27¾ per cent. of the whole rotative energy of the fly-wheel is absorbed during the short period of speed change. Normally between 15 and 20 per cent. reduction of speed is allowed.

Mr. Jefferies pointed out that live steam was expensive to use for the reversal, as compared with the electrical equipment. In the latter, the motor is made to act as a generator and pumps back into the generators of the fly-wheel set, and the generators in turn deliver it again to the fly-wheel. In this way over 60 per cent. of the rotative energy of the mill motor, rolls, etc.—which, in steam driven mills, is lost—is returned to the fly-wheel and made available for use on the next pass. With the use of a steam engine there is also the liability of serious breakages, while with the electrical set, the operation is perfectly smooth and breakages due to the shock of reversal are eliminated. The time of acceleration of the mill

motor from practically zero to full speed is only one and one-half seconds during some of the short passes.

Curves were also shown indicating the efficiency of the Ilgner set taken as a unit, based on approximately 1,200 tons of finished 3½ x 4 in. billets. The input, as shown by one of the curves, being 139,043 kilowatt seconds, this gives a power consumption of 19.81 kw.h. per ton of steel and an average

Operators' Pulpit, Electric Rolling Mill

indicated input of 959 kw.h. It is interesting to note how close the above 19.81 kw.h. per ton agrees with data taken from actual operating conditions, which showed a consumption of 19.2 kw.h. per ton. This indicates that the efficiency curve is fairly reliable under the conditions assumed, which conditions are maximum tonnage and minimum size that is possible to be rolled on this mill and fly-wheel set not disconnected from line.

The great advantages of the type of drum controller used, as compared with steam equipment, was pointed out by the speaker. This electrical controller can be operated by a man for a full day without any undue exertion, while with the steam installation, the strain on the operator is such that he can only work for an hour at a time and then lay off for an hour.

Greatly Decreased Costs

Further advantages of the electrical set were illustrated by a cost data sheet thrown on the screen, showing that the power cost in the Steel Company's plant was 36 per cent of the total cost of production, including interest and depreciation, while it was pointed out that with steam equipment the power costs would probably reach 80 per cent.

Summing up the advantages of the Ilgner system, the speaker saw them as follows:

- Low cost of power.
- Low cost for repairs and maintenance.
- Stand-by losses nil.
- Small time to get under way from complete shutdown to rolling conditions.
- Few delays necessary.
- Part of rotative energy of mill parts.
- Recovery for useful work.
- Speed proportional to displacement of controller lever from off-position.
- Motor does not race when steel leaves rolls.
- Constant turning moment.
- Mill breakage less.
- Simplifies mill layout.
- Small area or ground space needed.
- Lends itself to centralization of power.
- Ideal load to add to any generating station.

The Electric Propulsion of Ships—Equipment of "New Mexico" Battleship

The possibility of propelling ships by electric motors has for a long time been considered, but it was only after the turbine-generator had attained a high state of development in the matter of efficiency and lightness that any justification for electric propulsion began to be evident.

The most recent attempt at electric ship propulsion is in the case of the New Mexico battleship of the U. S. Navy. This is a 32,000-ton ship and is stated to be the most powerful battleship afloat.

The contract for the electric propelling equipment of the New Mexico included the following machinery:

Two main turbine-generator units, complete with throttle and governing valves.

Four main propelling motors.

Switches, panels, instruments, controllers, cables, insulators, etc., complete.

Two main motor-driven circulating pumps.

Two main motor-driven air pumps.

Two main motor-driven hot-well pumps.

Four motor-driven lubricating oil pumps.

Two motor-driven oil coolers and tanks.

Motor-driven blowers for ventilating the main motors.

Spare parts for the above apparatus.

The following information covering the electrical equipment is of special interest:

Of the two main turbine-generator units, each generator is designed to develop 10,500 kw. at 78 per cent. power-factor, and 13,500 kv.a. at full speed of the ship, and to carry a 25 per cent. overload (16,850 kv.a. at 78 per cent. power-factor) for four hours. The rotors have two poles and a maximum rotative speed of 2100 r.p.m. which corresponds to a frequency of 35 cycles. The stators are wound two-phase with leads brought out from the beginnings and endings of each phase to an 8-pole, double-throw, disconnecting switch placed in the main circuit between the generators and the motors. By manipulating this switch two generator connections are available: first, diametrical, two-circuit, low-voltage (3000 volts); and, second, square, one-circuit, high-voltage (4240 volts). With a constant flux, the voltage will vary directly or inversely as the $\sqrt{2}$ depending on the connection involved. Suitable interlocks have been installed, making it impossible to operate the two generators in parallel.

All speeds of the ship up to 17 knots inclusive are obtained by the use of one generator having the low-voltage connection, the generator furnishing power for driving the four motors. Above 17 knots, two generators having the high-voltage connection are used, each generator furnishing power for driving two motors. The main turbine-generators are used only for propelling the ship, and are in no way connected to the lighting or other auxiliary power circuits. Therefore, it is possible under the varying conditions of load to adjust the voltage and current to obtain good efficiency.

24 Per Cent. Margin of Power

The generators are conservatively designed. Compared with the maximum rated machines for land practice, the relative armature reaction is considerably lower and the densities in the magnetic section are slightly higher. Sufficient excitation current is applied to the generator fields to insure keeping the motors and generators in step. In other words, the generators are not working at the peak of the kilowatt

curve, but at a safe distance down where there is sufficient margin in power to take care of the rudder swings and heavy seas. Based on the maximum power-factor of the motors, 79 per cent., the generators have a margin in power of 24 per cent. with the excitation given.

The induction motors, direct connected to the ship's propeller shafts, are two-speed motor with connections for 24 and 36 poles. The speed reduction between the generators and the motors when using the 24-pole motor connection is 12 to 1, and with the 36-pole connection, 18 to 1. Hence, the extreme range of generator r.p.m. for the specified operating speeds of the ship, 10 to 21 knots is approximately 1440 r.p.m. to 2100 r.p.m.

Since the motors and generators were especially built to operate together, more liberty in design was allowed. A new type of winding was designed, the coils of which were so grouped that a change in the connection at the motor terminals would give a balanced quarter-phase distribution for either 24 or 36 poles. This gives a simpler control than if the motor were wound three-phase. In addition, since the four motors receive power from two generators at full speed and one generator at cruising speed, the best combined operation is obtained with a decreased voltage on the 36-pole combination. This also works out best for a quarter-phase winding; by connecting the generators in square connection for high speed and parallel connection for low speed, the correct ratio of operating voltage is obtained. By this scheme of connection, eight terminals were brought out of the motor though only four-line leads were required.

The specified requirements for driving the New Mexico propellers called for 26,500 h.p. at 161 revolutions per min.

Type IQ-24/36-7250/2175-175/124KK-4200/3100, V. Motor—
Stator and Rotor

corresponding to 21 knots ship speed, and 8350 h.p. at 112 revolutions per min. for cruising at 15 knots.

The motors were wound to operate with an output of 6700 h.p. at 4000 volts on the 24-pole connection and 2050 h.p. at 2800 volts on the 36-pole connection with an overload capacity of 8375 h.p. at 173 r.p.m.

At speeds from 8 to 15 knots, the four motors are operated on the 36-pole connection from one generator with its winding connected in parallel, the switching being so arranged that either generator can be used. The variation of speed is obtained by steam control on the turbine-generator.

From 15 to 17 knots, the motors are thrown over to the

Type IQ-24 36-7250 2175-175 124-KK-4200 3100 V. Motor—Left, section of Rotor; middle and right, sections of stator

24-pole connection still using one generator only. About 17 knots, two generators are used connected in two squares. The two motors and generator on the starboard side and the two motors and generator on the port side are connected together and each set operated as separate units.

For reversing, the 36-pole connection only is used. If the motor is running on the 36-pole connection one phase is reversed. If operating on 24-poles, the connections are changed over to 36 poles and reversed.

During the trial run a test of this reversal was made with the boat running at a speed of 21.25 knots. At this speed the motors were reversed and the screw was brought up to full-speed astern on the 36-pole connection (two-thirds of the forward speed) in 20 seconds; 12 seconds of this time being used in switching.

Two 300-kw. turbine-gear-driven, direct-current generat-

ing sets, arranged for either 120 or 240 volts, supply the excitation and power for the auxiliaries mentioned in the beginning of this article. There are also two motor-driven boosters supplied, one for each generator field. These boosters can either boost or lower the voltage 60 volts; in other words, if the field is connected to the 240-volt circuit the excitation voltage can be varied from 180 to 300 volts, and if on the 120-volt circuit from 60 to 180 volts.

In order to obtain quick reversal, increased field excitation is always used and can be obtained only by pulling the field lever by hand against a heavy spring which brings the excitation back the instant the lever is released. By this arrangement, injurious heating of the field is prevented.

The information given above is taken from a series of articles appearing in the April issue of the General Electric Review, of which advance proofs were kindly forwarded us.

Government Control Through a Commissioner's Eyes

By Charles E. Elmquist*

Government control and operation of rail, water and wire lines will probably force the issue of government ownership in the 1920 campaign. This is indicated by the testimony and views of government officials and by the action of organized labor and certain groups of farmers and other interests. If the people decide to continue government control or to purchase the properties, a strong sentiment may be expected to develop for municipal ownership of other public service corporations.

While there is no direct relationship between steam railroads and electric railways, the question of ownership is going to be ultimately determined on principle. Should it be decided to purchase the steam railroad and wire systems, there is no escape from the conclusion that public sentiment will also demand the purchase and operation by the people of street cars and other utilities in a great many places.

In a local sense this sentiment will be augmented by the conditions which now confront the electric railway lines. The increased operating costs have forced many companies, and the nickel fare has become the exception rather than the rule. But every rate increase takes from the customer something which was given to him by contract or by order of a commission, and he is likely to feel that he has been deprived of his just rights.

Hence in the near future one may expect an insistent demand for the reduction of fares, tolls and charges. Petitions will be filed with the proper authorities challenging the reasonableness of the higher rate. In all such cases the commissions or courts must be governed by the facts presented, because there is nothing more certain than the regulation of

rates must be controlled by facts and operating ratios of utilities will decrease, but it is more than likely that adjustments will not be sufficiently rapid to satisfy the public demand for reduced rates.

During this period the pathway of regulating officials will not be strewn with roses. If the facts will not permit a reasonable reduction of rates, an agitation for municipal ownership of these plans can be expected. The people will feel that by possession alone can they secure the rates which in many instances were agreed to as a condition precedent to the occupancy of the streets.

These preliminary observations lead me to the following conclusions:

Municipal Ownership

Immediate attention must be given to the question of municipal ownership. Facts for and against should be compiled and distributed so that the people may have a chance to decide the question upon its merits. The only known preventive is a satisfied public. Efficient service, reasonable rates, courteous treatment of patrons and justice to employees as well as to investors should characterize the conduct of these utilities. No company can successfully defend itself against a hostile public.

National Co-operation

While electric railways are local and perform a service which is largely local, yet their interests are identical in that most of them are confronted with the same kinds of difficulties. It might be profitable for the national organization to continue a study of all questions dealing with improvements and economies in service and to make suitable recommendations to the local companies.

Reforms cannot be made in a month or a year, but if

*President National Association of Railway and Utilities Commissioners. Address before American Electric Railway Association.

all the managers take hold of the problem in a broad way and endeavor to follow the recommendations of a central body, they will be able to accomplish much to the mutual interests of themselves and the public.

Uniform Rate Procedure

Rate adjustments should be, and as a matter of fact are, largely questions of facts. They involve consideration affecting the revenues and expenses, competition, prospective earnings, investment and value. The controlling principles should be the same everywhere in this country. In the consideration of petitions for reduced rates, the courts and regulating tribunals are entitled to have the questions fairly, honestly and intelligently presented. The same theory of defense should be presented in California and Maine, Illinois and Texas.

A large saving could be made of the time, labor and expense of these utilities, as well as of courts and commissions, if a substantially uniform method could be adopted for the presentation of rate questions. It would seem that such a plan could be successfully worked out by a committee representing the American Electric Railway Association.

Corporations try their cases before courts with great skill and ability, but unfortunately it is a too common practice for them to appear before commissions without proper preparation. Times without number, representatives of the carriers have appeared before the Minnesota commission to favor or oppose a petition, without having agreed upon a course of action, and with no one there prepared to offer an intelligent statement. Each carrier, when called upon, would re-state the opinion of the first speaker. Frequently their cause was just, but it had to be denied because there was no evidence. This practice is not local to Minnesota.

The purpose of a public hearing is to give a fair trial, at which time evidence may be offered by both sides. Hearings would result in a farce if real consideration were not to be given to the evidence in the case. Commissions are busy, and their burdens would be greatly relieved if corporations presented cases in a clear-cut manner. They should give facts instead of opinions, and always bear in mind that public servants are watched and that an order made in a litigated case, which is not supported by evidence, is arbitrary and illegal and subjects the commission as well as the corporation to serious criticism, and that such proceedings are likely to result in unfriendly legislation.

Accounting Uniformity

Considerable progress has been made in an effort to establish a uniform accounting system for utilities. It is not always easy to harmonize the conflicting ideas of the accountants who represent the states and the federal government, and this problem is made even more difficult because the views of utility representatives should also be considered. Uniformity is desirable, and every effort should be made to bring it about.

Of course, there may be local conditions necessitating the compiling of special or additional information. As president of the National Association of Railway and Utilities Commissioners, I shall urge the committee on accounting to give special consideration to this matter, and I earnestly hope that real progress may be made during the year. May we not look for co-operation from a committee appointed by the American Electric Railway Association?

Definite Valuation Plan

Public ownership involves the purchase of the utilities. This is brought about by agreement or condemnation. In view of the prominence which is to be given to the question of municipal ownership, the utilities should not be guilty of "watchful waiting." Preparations should be made for the day when the properties may be taken over. The people should

not pay more than the properties are worth, and it is difficult to determine the price in the absence of a physical valuation.

The principles of valuation are not definitely settled. Unfortunately, there are as many different ideas upon this subject as there are lawyers and engineers who make a study of it. Hence it is important that the American Electric Railway Association investigate the problem through a proper committee, authorized to formulate rules and suggestions for the guidance of the companies. A definite plan would be exceedingly helpful to the public as well as the corporations, and it might result in an early judicial determination of the correct principles of valuation for use in purchase, rate-making, taxation and capitalization proceedings. I strongly urge that conservative action be taken by this committee. In the last analysis, nothing is to be gained by claiming everything of present or prospective profit, elements both tangible and intangible, visible and invisible, in the heavens above or the earth beneath.

The steam carriers believed there was advantage in united action. When the government began the valuation, the steam railroads appointed a conference committee, which selected able lawyers, engineers and accountants who were to devote their attention exclusively to this work. This committee brought to the attention of the Interstate Commerce Commission all the law upon the subject, and it compiled a mass of statistical data and expert opinions which greatly aided the commission to arrive at its conclusions in the early valuation cases.

Valuation will play a more important part in rate cases than it has in the past. We seem to have drifted away from the anchorage of contract fares. Rates should be determined by facts rather than by negotiation or compulsion. The public suspects that there is over-capitalization in many of the electric plants. This suspicion will not be allayed until the people know what these plants are really worth.

If the securities are excessive, they should be written down to the basis of the real value of the properties used in the public service. In connection with this subject, it will not do to overlook the fact that original cost is an important element to be considered in arriving at value, and that commissioners are insisting that this item be shown.

Indeterminate Franchises

The experience during the war will result in a greater assertion of authority by the states over the rates of electric railways than heretofore. The rapid increase in the cost of wages, fuel and supplies brought the public face to face with the fact that public service cannot be efficiently rendered by a company which pays out more money than it takes in.

Fixed rates and flexible costs are inconsistent. Every student realizes that both elements must be variable in order to meet changing conditions, and that the determination of the rate to be charged should be made by a body of expert men. Courts no longer attribute sacredness to a franchise rate. The doctrine that a state may fix a reasonable rate for a local utility unless restricted by constitutional limitations has become the accepted law.

We have entered upon a new era in the regulation of local utilities. At this time emphasis should be given to the importance of transferring to the state authorities the ultimate determination of rates, subject of course to an appeal to the courts. The fairest way to meet necessary changes in conditions and to secure for the public, as well as the corporations, that enlightened consideration to which all are entitled, is for the state to issue indeterminate permits in lieu of existing local franchises.

It is not necessary to discuss the merits of this plan. It has been tried out in several jurisdictions and found to be acceptable. The advantages to the companies, the investors and the public are many; the objections, few. Tested by

experience and the judgment of earnest and competent men, it seems to come nearer meeting the requirements than any other plan that has been suggested.

But this presents a legislative question, and laws must be passed to suit the needs of a particular state. The American Electric Railway Association should arrange to have prepared an article fully setting forth all of the advantages and the disadvantages of the indeterminate plan. Then all interested parties could have the benefit of the best arguments on both sides of the question.

The extent of state control depends entirely upon local conditions. I have found that state commissions do not relish the idea of exclusive control of street car companies by the state. Many of them believe that the municipalities should retain their powers over these utilities, subject, however, to an appeal to the state commissions. This is not a denial of the right of home rule. It substitutes a board of experienced men for a court in passing upon disputes between utilities and municipalities.

Sliding Scale of Return with Combined Services

The Electric Railway Journal prints the following report of the work of the Commission appointed to investigate the affairs of the New Brunswick Power Company, St. John, N.B.: The Company is at present concerned in a very interesting proposal in connection with utility regulation. An investigating commission has proposed resettlement which provides a most striking combination of the service-at-cost principle with a sliding scale of return on investment, based on combined rates for railway, electric and gas service.

In 1918 the Lieutenant-Governor in Council was empowered by the Legislative Assembly of New Brunswick to appoint a commission to examine the condition of the company and make recommendations in connection therewith. The members appointed were Guy W. Currier, chairman; Henry Holgate and Prof. Albert S. Richey. This commission has now reported certain recommendations which it is believed will be of interest to electric railway operators.

It is recommended that the control of operation, maintenance, service and rates be vested in a board of seven directors, four elected by the company and three appointed by the Lieutenant-Governor in Council for three-year terms at annual salaries of not more than \$1,000. Moreover, it is said that an experienced public accountant should be chosen annually by the public directors, with the approval of the company directors, to report semi-annually on financial operations.

The commissioners are of the opinion that no special taxes of any kind should be assessed against the company, which should be required to pay only such property, income and other taxes as are paid by other general corporations in the province. The company should not be required to pay for any street or road repairs, except those made necessary by the maintenance, renewal or construction of its own way and structures, or for the removal of snow from any street or road or for any part of the cost of construction of new pavement or change in the pavement. The company should not be required to pay rental for the use of any street or bridge beyond the expense of maintenance of tracks. The reason given is that such tax payments would be reflected in the cost of service and thus result in higher rates.

The board of directors would fix from time to time such rates for railway, electricity and gas services as would meet but not exceed the cost of service, which should include oper-

ating expense, taxes, maintenance, depreciation allowance, return on investment, and any other expenditures properly chargeable against income. An annual allowance of \$75,000 should be set aside out of earnings for depreciation (to be increased as the investment increased) until the fund amounted to at least \$200,000 and in no case less than 7 per cent. of the rate base, after which time such an amount should be added annually as would keep the fund intact at this sum. The directors should charge to the annual cost of service, as a return on the rate base of January 1, 1919, 7 per cent. of such base, plus or minus additional percentages according to the fares and service charges in force.

Rate of Return to Be Between 6 and 9 Per Cent.

At the time of the semi-annual audit, the accountant should determine the average fare received per passenger, the average rate per kilowatt-hour and the average rate per thousand feet of gas, and calculate such average rates as percentages of similarly calculated average rates during the six-month period from January 1 to June 30, 1919. By giving due weight to these three percentages, based on the proportionate amount of gross revenue received from the different services, he should then calculate the weighted average percentage by which the rates during the preceding six months had been increased or reduced compared to those in effect during the period from January 1 to June 30, 1919.

The theoretical rate of return on the rate base for the following six-month period should then be 7 per cent. plus one-tenth of 1 per cent. for each 1 per cent. by which such weighted average rate for service had been so reduced. Similarly, the theoretical rate of return should be 7 per cent. minus one-tenth of 1 per cent. for each 1 per cent. by which such weighted average rate had been so increased. The actual rate of return, however, should be not less than 6 per cent. or greater than 9 per cent., notwithstanding the fact that the theoretical rate of return might be greater than 9 or less than 6 per cent.

The commissioners recommended that legislation providing for the above features be passed and that the acceptance of the new legislation shall be made to constitute an agreement on the part of the company to sell at any time to the province or any of its political subdivisions all the property included in the rate fare for cash equal to the rate base as then determined plus 10 per cent. and any premium required to retire bonds. The company should then be protected from competition on the part of private or municipal plants.

Motormen and conductors on the Winnipeg Electric Railway, who are now drawing 39 to 47 cents an hour, have put in a demand for an increase to 60 to 70 cents an hour, together with a straight rate of \$25 a week for extra men. These demands are made on the basis of an eight-hour day, and would involve the expenditure of an additional \$750,000 a year by the company. It is understood that, before giving an answer, the company will endeavor to secure an increase in fares.

Municipalities in the counties of Huron and Bruce recently sent a delegation to Toronto to wait upon the Hydro-electric Power Commission of Ontario asking that several districts be supplied as soon as possible with Hydro power. The following blocks are asked for: Wingham, 500 h.p.; Teeswater, 100 h.p.; Blyth, 150 h.p.; Lucknow, 100 h.p.; Ripley, 75 h.p.; Kincardine, 250 h.p.; Port Elgin, 300 h.p.; Fordwich, 50 h.p.; Gorrie, 50 h.p.; Brussels, 100 h.p.; Paisley, 100 h.p., and Southampton an amount undecided. The Hydro Commission will proceed with estimates.

Twin City Rapid Transit Company Installing Coasting Recorders

An interesting experiment is being tried out by the Twin City Rapid Transit Company in the purchase of some 1,100 Rico coasting recorders. The results to April 1 of this year are given in the latest issue of the Electric Railway Journal.

Coasting Saves Power in Twin Cities

As of June 15, 1918, the Twin City Rapid Transit Company had already installed 340 out of the 1,100 Rico coasting recorders purchased to outfit its system completely. Other lines are in process of being equipped and while the installation is still not complete the company is well pleased with the results obtained.

Records were taken from the time the first recorders were put out, but the first comparative statement for the information of the men was not issued until April 1. This was accompanied by a bulletin from General Superintendent Caufield, who explained why men on the extra list would be grouped by themselves for the sake of fairness. Mr. Caufield also pointed out that a man's costing record was in direct proportion to the amount of his willingness and earnestness to "Save and Serve."

At the very beginning of the year 1918 the company issued to the trainmen a booklet entitled "Doing Our Bit—Coasting and Its Relation to the War." At the opening was this quotation from Bulletin 183 of the United States Fuel Administration: "An investigation convinces us that electric railways offer a chance for large savings." The relationship between coasting and fuel saving was succinctly portrayed thus:

MORE COASTING ➡ LESS POWER
LESS POWER ➡ LESS COAL

An informal coasting campaign had indicated to the company that with the co-operation of the trainmen the total amount of coasting then being done could be increased by not less than 10 to 15 per cent. This estimate, as will appear later, already was very greatly exceeded—a compliment to the management, the men and the coasting recorder.

The remainder of the pamphlet gave the men good suggestions on how to operate more efficiently through increased coasting and how to key the coasting recorder and turn in the printed record therefrom. The conclusion said: "The more you coast, the more coal you will save, the easier will be your work, the less will be the wear and tear on the car equipment, and the safer and more comfortable will be the ride of passengers, the customers who pay your wages."

"In the interest of safety and economy, and on behalf of the nation at large, the management asks the hearty co-operation of each trainman toward the successful carrying out of this campaign."

That the men responded heartily from the start to this appeal to save power is clear from the following results secured during the first half of last year:

Coasting Percentages on Twin City Lines Out of Nicollet Station

	January	May	June
Marquette and Grand	25.6	31.2	30.2
Fourth Avenue South and Sixth Avenue North ..	21.5	25.7	24.9
Monroe and Bryant	22.0	28.7	28.1
Fifty-fourth and Columbia Heights	22.2	27.8	26.8
Extra list	23.9	25.5	25.4

It is hardly necessary to point out that from the very beginning the men showed a big advance over the ordinary unchecked motorman. The slight drop in June did not indicate a decrease in efficiency, because some of the lines were speeded up at the same time that increased the number of stops per mile. Nor is any attempt being made to drive the men. The management is satisfied that if the men are thoroughly imbued with the importance of coasting they will continue to improve steadily and permanently. It is much more

to the point to have a good general average than a few very high ones and a mass of low ones.

On the basis of only 30 per cent. equipment of the Twin City lines with coasting recorders, Chief Engineer Scofield found an energy saving of 5 per cent. for the whole system, which would indicate a saving of at least 16 to 17 per cent. for complete installation. Mr. Scofield has kept careful records of energy consumption per car-mile over many years. With due allowance for weather and temperature conditions, the saving can be accounted for only through the correct use of the coasting recorders.

Riviere du Loup Extending Plant

The city of Riviere du Loup, P.Q., has given out contracts for power house equipment for improving and extending the existing lighting and power system. The plans were drawn by Mr. J. Allyre Roy, C. E., of Montreal. At present there is a small plant located in a power house at the foot of the Riviere du Loup Falls, situated in the centre of the city and owned by the municipality. The falls are capable of developing 1,500 h.p. at the minimum flow. The plans provide for the conversion of the existing system from two phase to three phase, and the extension of the system to St. Patrick, an outside municipality; another outside municipality, Cacouna, will also be supplied by the system. At present the street and house lighting are on the same circuit, but under the new plans there will be separate circuits. Provision is also made for future extensions. About 250 h.p. is now developed with an old type turbine. This will be replaced by a new water wheel, working under a 98 ft. head, supplied by the S. Morgan Smith Co., York, Pa. It is of the horizontal type, 525 h.p., 600 r.p.m., direct connected to the generator. This will allow of the development of power to the full capacity of the penstock already constructed. The Canadian Westinghouse Company have secured the contract for the 400 kw., 60 cycle, 3 phase, 2200 volt, 600 r.p.m. generator, belt-driven exciter, three regulating transformers, switchboards, etc.

Saskatchewan May Have One-Man Cars

In the Province of Saskatchewan, up to the present session, the law has made it impossible to operate street cars except in charge and under control of at least two competent men, a motorman and a conductor. It has thus been impossible to introduce one-man cars. The operation of such cars, however, has been so successful in other places on this continent that an amendment to the law has been agitated for the last three or four years and during the last session, the Saskatchewan Legislature has amended this Act to such an extent as to make it possible to operate one-man cars at the option of any city or town.

A by-law will be submitted in the near future asking authority to commence work on a high tension transmission line connecting Winnipeg with Portage la Prairie, Man. This scheme has been talked about for several years and it is now believed that plans will be ready to commence the work within the next two or three months. It is suggested that construction shall be carried on by the electrical departments of the two cities, using day labor. The estimated cost of the work is placed at \$350,000.

Henry Ford is said to be working on plans for a street car to be driven by an internal combustion engine and which will be demonstrated in Detroit this summer.

The Contractor-Dealer

Joint Industrial Council of Building Trades Formed in Toronto with Representation from Toronto Section of the Ontario Electrical Contractors' and Dealers' Ass'n

Following a considerable amount of preliminary work, a Joint Industrial Council of the Toronto Building Trades has been appointed to deal with problems and points at issue between employers and employees. The council consists of ten members, five representing employers and five representing employees. Mr. Geo. Kay, of the Bennett & Wright Co., is the representative of the Toronto Section of the Ontario Association of Electrical Contractors & Dealers.

Below we print the draft of the proposed constitution which, we understand, has been agreed upon, subject to any changes that may be found necessary as the work of the Council proceeds. The plan follows pretty closely the well-known Whitley plan, which has taken such a hold in England:

1. Name

This council will be known as the Joint Industrial Council of the Toronto Building Trades.

2. Aims and Object

To harmonize and standardize the conditions of contracting and employment in the Toronto building trades, and to secure the largest possible measure of joint action between employers and employees, for the development of industry as a part of national life and for the improvement of the conditions of all engaged in that industry.

3. Membership

The council shall consist of ten (10) members, with power to add to their numbers. Representatives shall be as follows:

- Two from Builders' Exchange.
- One from Ontario Association of Electrical Contractors and Dealers.
- One from the Toronto Society, Domestic, Sanitary and Heating Engineers.
- One from International Master Painters' Association.
- Five from Building Trades' League.

4. How Elected

Representatives shall be duly elected by their respective bodies (see clause three) and it is further provided that it shall be optional for both parties to elect alternatives.

5. Chairman and Vice-Chairmen

The chairman shall be a co-opt. member; he shall be a disinterested person, and shall be elected by a majority of the council. There shall also be two (2) vice-chairmen, one to be chosen by the employers and one by the employees.

6. Secretary-Treasurer

The council shall be empowered to maintain a secretary-treasurer and such other clerical staff as it may think fit.

7. Term of Office

The representatives to the council shall retire annually, and shall be eligible for re-appointment by their respective

bodies. Casual vacancies shall be filled by the association concerned, which shall appoint a member to sit until the end of the current year.

8. Committees

The Joint Council may appoint committees from time to time, as may be deemed advisable, and such committees shall report back all matters referred to them for confirmation, unless otherwise determined by the Joint Council.

9. Co-Opt. Members

The council shall have the power of appointing on committees, or allowing committees to co-opt. such persons of special knowledge, not being members of the council, as may serve the special purposes of the council.

(a) The two associations in the council shall be equally represented on all committees, and (b) any appointed co-opt. members shall serve in consultation capacity only.

10. Duty of Officers

(a) The chairman shall preside at all meetings of the Joint Industrial Council, and all committee meetings, and shall perform such other duties as are usual for such an officer, provided, however, he shall have no voting powers.

(b) The vice-chairmen shall, in order, perform the duties of the chairman, in the advent of his temporary disability, or his absence from meetings. They shall have voting powers by virtue of their membership in the Joint Industrial Council.

(c) The secretary-treasurer shall keep a record of the proceedings of all meetings of the Joint Council, receive all moneys, and render a correct statement of same, at each general meeting of the council. He shall perform such other duties as appertain to his office.

11. Meetings

(a) The meetings of the Joint Council shall be held as often as necessary.

(b) The regular meetings of the Joint Council will be held on the first (1st) Monday of each month at 2 p.m., in the office of the Dominion Government Fair Wages Officer, or such other places as may be determined by the Joint Council from time to time.

(c) A special meeting of the Joint Council shall be called by the chairman within two (2) days of the receipt of a requisition from any of the constituent associations. The matter or matters to be discussed at such meetings, shall be slated upon the notice, calling the meetings.

12. Voting

The voting, both in council and in committees, shall be by show of hands or otherwise, as council may determine. No resolution shall be regarded as carried unless it has been approved by a majority of those present on each side of the council.

13. Quorum

The quorum shall be three (3) members on each side of the council.

14. Finance

The expenses of the council shall be met by the Em-

ployers' Association and the Building Trades' League, in equal proportion.

15. How Amended

This constitution may be amended by a majority vote of all the duly elected employee representatives, together with a majority vote of all the employer representatives. Amendments must be proposed in writing at a regular meeting, and no vote shall be taken thereon until the regular meeting following such presentation. No amendment shall be adopted that will destroy or limit the equal voting power of the employee representative and employer representative in the Joint Council.

16. Order of Business

- (1) Roll Call.
- (2) Reading the minutes of the preceding meeting.
- (3) Business arising out of the minutes.
- (4) Secretary-treasurer's report.
- (5) Communications and accounts.
- (6) Deferred or unfinished business.
- (7) New business.
- (8) Good of the council.
- (9) Adjournment.

Merchandising!

Mr. Corcoran Tells Large Gathering of Toronto, Hamilton and London Contractors and Dealers, and C.G.E. Sales Agents How To Do It—Outline of a Vigorous Selling Campaign

The regular monthly meeting of the Toronto section of the Ontario Association of Electrical Contractors and Dealers was held in the King Edward Hotel on the evening of April 3rd. It happened that this meeting coincided with a convention of Canadian General Electric sales agents throughout the Dominion who met in Toronto during that week and so a joint meeting was arranged. The primary cause of the joint meeting was an address on "Merchandising" delivered by Mr. Corcoran of the Commercial Service Department of the General Electric. Some two hundred were in attendance and the address was at the same time one of the most interesting and helpful that has been delivered before the contractors' association:

The speaker was introduced by Mr. Kenneth A. McIntyre, the president of the association, who mentioned that Mr. Corcoran happened to be a close friend of Mr. Goodwin's, a fact which would certainly not lessen the warmth of the welcome accorded him by Toronto electrical men.

Mr. Corcoran said it had been his fortune to work on sales campaigns for the General Electric Co. for a number of years and Mr. Goodwin had finally arranged for him to make a special study of retail merchandising. It was his object to talk on the phase of retail merchandising that deals with store sales. He had a series of charts which embodied statistics in a more than usually interesting form, but had been unable to bring them with him. However, he would give some of the figures from memory. "There are," he said, "in the United States 20,689,000 families, and 5,500,000 of these families are served by electricity, but these 5,500,000 families, according to latest information, are using only about 9,000,000 electrical appliances."

Getting down to the actual problems of merchandising, Mr. Corcoran proceeded: "There are a great many things that bear on the subject of retail merchandising—cost, stock insurance, and so on, but to my mind the fundamental thing is selling. The retail electrical merchandising business, as

far as the sales are concerned, depends upon the contact with the public. It is very important to know what these points of contact are. Reducing them to an even five, there is, in the first place, the exterior; next, the interior; next, publications; then, newspaper advertising, and, last, but not least, window display. In my talk tonight, I wish to emphasize window display, for, in analyzing the retail business, I believe the greatest asset of the contractor-dealer is his windows.

"However, the first point is store exterior. Location is, of course, fundamental. The better the location, the more people see it and the stronger is the contact with the public. In the second place, there is the store appearance. Has it a good appearance, or the appeal negative? The next point is the attitude of the employees. Are the men who are sent around to do your work courteous, neat and efficient?

"Then there is the store interior. The arrangement is very important, as well as the general appearance and trim. The employees also are, of course, a very big factor. Are they courteous? Do they suggest other sales? You probably all have heard the story of the president of the United Cigar Stores, who, on one occasion, sent out a telegram to every store in the firm's system asking, 'Did you say thank you to everybody you did business with today?'

"Next is the publications; here is another very important point of contact with the public. Every single manufacturer of electrical goods in Canada has these publications available for use, but do you use them? And then, there is newspaper advertising. Retail practice has shown that from 3 to 5 per cent of total business is usually well spent on advertising, but the advertising must be timely, attention-drawing, pertinent, to the point, and you must use good space. It is not necessary to do too much advertising on any one line. An overdose of any good thing will kill a man, or at least make him giddy.

You Are Selling "Service"

"For the benefit of the salesmen present, do you ever realize that you are not selling goods but the service the goods are intended for. A certain article is made to perform a certain service—a motor is made to move, and the purchaser wants it because it will run. The dealer, however, does not buy it primarily because it will run. He buys it because it will sell. Of course, the sales value depends on its characteristics. The manufacturer puts into that article a certain amount of an intangible something we may call "sales power." He builds that up by means of advertising. If the article is advertised to a great extent so that it almost sells itself, it has 100 per cent. sales power. The full sales power of any device, however, cannot be realized unless the contractor-dealer will help. In other words, he has got to do retail electrical merchandising. There are five different motives which influence the purchaser; foresight, saving, pride, comfort and utility. Every advertisement must appeal to some of these buying motives. It must have interest, creating attention, then desire, and, finally, action. If you remember these points, I believe you have the fundamentals of applied retail merchandising."

The speaker then proceeded to point out the value and importance of window displays. He believed it was not fully realized, and instanced many cases in which the results obtained from attractive and timely displays were nothing short of astonishing. One customer of his firm, he said, telephoned him last summer, complaining that electric fans were not selling rapidly in the contractor-dealers' stores, while on dropping into the department stores he found they were selling like hot cakes. The speaker himself had been in New York the week before and had found that the department stores had their show windows full of fans, while over 90 per cent of the electrical contractors hadn't a fan in their windows at all. So he told his complainant that what was

needed was to have the contractor-dealers display the fans. Sometimes the contractors talked about competition by other stores, but in New York city, there were just two department stores showing fans, while there were over 1,500 contractors in the city. What chance would the department stores have had if the contractor-dealers had displayed the fans in their windows. That is one point of contact that it costs nothing to use and which is most effective.

What One Display Did

Another instance, the speaker gave, was where he had asked one of their men, making laboratory merchandising experiments in Troy, N. Y., to have a fan window display put in a store in that city. He put the display in on Monday and on Thursday had to take it out, having sold all the fans in stock except three. All the other contractors in the city reported the fan sales poor for the season. This man attributed the quantity of business done to the fact that he had fans in the window from the beginning of the season and that he had synchronized his display with the hot weather.

On one occasion, as an experiment, he had taken one of the worst-selling articles in the firm's stocks—a specialty which had been gotten out some years previously and which had really only been left in their catalog by mistake—and had worked this up in a window display in a dealer's store. The dealer said he had bought about ten of these articles ten years before and he thought he had them all in stock yet. However, he put in the window display and not only sold all there were in stock but also a number of others. This went to show that goods could be sold if put in the window.

Another rather humorous instance was cited, where a small dealer in Schenectady, who had bought his first electric washing machine and was rather proud of it, asked to have a window display made with it. The window was put in on Friday and the man came back on Saturday with a sad story. "I'm in trouble again," he said. "Just as soon as I finished that window display and was nailing up the show card, there was a fellow watching me and he came in and asked me about it and I had to sell it to him."

Following his address, Mr. Corcoran had an interesting film thrown on the screen, entitled "A trip to the Pittsfield Works," which showed in detail the manufacture of the company's fans in their plant.

Afterwards the speaker gave details of a fan campaign which has been worked up for the coming season by the General Electric Co. This, he said, contained all the essential features for successful retail merchandising except those that must be featured by the co-operation of the contractor-dealer. The company had gone as far as it was possible for a manufacturer to go.

He displayed the complete 1919 One Hundred Per Cent Fan Campaign material. This is what is given to every contractor-dealer who signs a G.E. fan contract. The company has taken as the corner stone of the campaign the slogan, "G. E. Fans refreshing as a summer shower." To carry out this idea, a rainbow has been designed to be placed on the inside of the glass of the contractor-dealer's window, making a very conspicuous display. It has been considered bad advertising to paste anything on the glass, but in this particular instance, this procedure is excusable because the real attention-getter is not obscured. The usual practice has been to paste a display on the glass, while the inside is filled with unattractive cartons, but in the G.E. display the interest is inside the window.

Another feature of the display is a color wheel which is attached to the fan motor, replacing the blades. The idea of a color wheel is not new, but its application to a fan is unique.

As a further corner stone of the campaign, a poster has been designed, entitled "Refreshing Draughts," which em-

phasizes the effects of G. E. fans. Quite unintentionally, the speaker assured his hearers, this was appearing in an advertisement in American magazines on July 1st.

Dealer Helps

To back up the dealers' advertising the company conducts an extensive national advertising campaign, using as the key-note this advertisement, "Refreshing Draughts," which is to appear in nearly all of the national magazines.

The contractor-dealer is also supplied with a portfolio entitled "The dealer's one hundred per cent. G. E. fan campaign," besides folders for homes, post-cards for homes, folders for offices, and so on. They are also furnished with different books explaining how the dealer can reach and get in contact with the buying public. One book is entitled "How to sell 100 per cent. more electric fans." On the inside of the cover are 100 ways in which G. E. fans can be sold. The idea of using the "One hundred per cent." in the title of the campaign is that the company manufacture 100 per cent. more fans than in 1918, the dealers buy 100 per cent. more fans and sell 100 per cent. more.

The booklet contains the complete plan of campaign. It also shows picture of theatres, homes, offices, etc., in which the G. E. fan may be used and gives a list of the different places which are prospective customers. When the dealer reads this he begins to realize that there are tremendous possibilities in the business. A chart is included indicating how the field may be reached.

There is also a Mail Campaign Book for G. E. fan dealers, which gives the necessary instructions for conducting a mail campaign—how to get mailing lists, the different publications available for reaching the different classes of trade, etc., and a letter is furnished, varied to suit homes, theatres, restaurants, hotels, stores, general offices, etc., also a return card for every letter the dealer sends. It has been proven that the use of a return card increases replies by 12 per cent.

Instructions are given on window display, with general suggestions as to how to trim. The display, including the rainbow fans and cutouts, is fully explained, and also trims that the dealer can readily put in. Window show cards are also furnished.

Here the speaker drew attention to double page spreads which would be featured in the Saturday Evening Post and Collier's. In the fan book, he pointed out, there were different suggestions for merchandising, also a list of special uses of the fan, such as ventilating sick rooms, ventilating kitchens, drying varnish, keeping frost off store windows. In the end of the summer people who required fans might be tempted to postpone buying till the next season, but they might be induced to purchase by pointing out the value of the fan in heat distribution if turned upon the radiator or set to pull the heat out of a hot air register.

There is also the G. E. sales calendar. The company has taken the one hundred fan sale days and divided these into three parts: the preliminary work, the intensive effort and the clean-up. On April 14 commence your campaign by reading your plan carefully; April 18, lay out newspaper campaign; and so on till April 30—then a hint, "Are you in the habit of mailing advertising matter with your monthly statements?" June 11, feature Saturday Evening Post two-page spread to-day. By thus taking advantage of the company's campaign, the dealer gets a cumulative force of advertising. On August 11, the instructions are: Show winter uses of fans. Spaces are left for memoranda, so that the dealer can lay out his whole campaign in advance and thereby reap the full value of the seeds which are being sown by the national advertising. Thirty million magazine readers, it was stated, would see the G. E. fan advertising.

On the G. E. boxes last year the ordinary old-style

label was used, but this year they have standardized on an attractive label colored blue and orange. Instead of the common corrugated carton, they now have a very pretty carton which would look well in window displays.

The speaker said that the G. E. Company had tried to make their campaign so complete and so flexible that it would reach every class of customer. In conclusion, he read extracts from one of their folders, entitled "Rules for Office Boys," which very humorously suggests ways in which the office boy may save himself work by making sure that the fan is not in operation.

A hearty vote of thanks brought the evening's proceedings to a close.

Selling by Telephone

Put Your Telephone on Your Sales Staff, Too— Possibilities for Much Good Pioneer Work

No person with anything to sell can afford to overlook the "telephone" as a selling agency. It saves an infinite number of useless calls when the prospect is not in or is too busy to talk to visitors. As a means of clinching business it cannot, perhaps, be classed with personal calls, but as opening the way to appointments for talking matters over it surely has no equal. There are few cases where a tactful manner and a pleasant voice cannot interest the person at the other end sufficiently to induce him or her to make an appointment to talk things over and in the interval it is pretty certain that the matter will be given some thought by the prospect. Following this lead the Society for Electrical Development have prepared a number of suggestions which are bound to be helpful in securing orders, if intelligently carried out.

How to Promote Business by Telephone

Central stations, electrical dealers and contractors having something to sell—either service, or merchandise, or both—should not overlook the value of the telephone in promoting their business. There are times when personal visits of the sales force are impractical, or impossible, times when the mails cannot be counted on to get results. That is the time to try the telephone. In fact, one dealer epitomized it this way: "when in doubt—telephone." The ideas outlined herein may not fit every man's business like a glove, but certain principles laid down can be put to work to boost any business.

Ways to Use the Telephone

The telephone can be used in a variety of ways. It can be utilized (1) to secure and classify prospects, to prepare mailing lists, (2) to interest prospects, to follow them up, win attendance at demonstrations, exhibits, displays and to pave the way for the salesman's call, (3) to develop more business from old customers, (4) to secure actual orders for merchandise, (5) to facilitate collections, (6) to adjust complaints and render service to customers.

Before any man decides to use his telephone in any of the above respects, he should first work out his plan of action, decide just what he wishes to accomplish, so far as possible analyze his field, and his ability to wage a telephone attack, and decide how he will follow up the work done by the telephone.

The first thing is to secure the services of a competent operator. In telephone selling, or solicitation for demonstrations and so on, a woman makes a better operator than a man—and a mature, experienced woman is better than a young girl. She should have, so far as possible, the instincts and training of a salesperson, and by all means must have a suitable, well modulated, clear, pleasant voice.

In planning to use the telephone it is well to start by recognizing that what is said over the wire should be as carefully prepared as any printed advertisement. The telephone approach is more often an advertisement that is spoken rather than written. It is just as important to be careful what is said and how it is said. Usually it is best to equip the operator with an outline of a good average monologue which she can memorize easily, and also to furnish her a few sentences that may help her meet the objections of the prospect. It is advisable that this monologue be spoken not in a matter-of-fact, sing-song voice, as though she were reciting a piece, but that she put into it all the qualities that would make it a personal message. In the talk, the more she can do to make the person at the other end of the line feel that she and the company she represents have a personal interest in the prospect's welfare, the better. It is, of course, impossible to write down all the possible objections that the party to be interested may advance, but as readily as the campaign develops, the operator can jot down the usual objections, and short, concise answers can be prepared to guide her.

In the main, of course, the less the operator has to memorize, and the fewer set forms of speech she has to refer to, the better for the success of the campaign.

To Secure and Classify Prospects

Good prospects and customer lists are necessary to every sales campaign. The central station customer list is the "last word" in this connection but this is not always available. It will be found that where this cannot be had, the telephone directory is a good substitute, as over 80 per cent of telephone subscribers have electricity in their homes. Of course, in the case of a house-wiring campaign, for example, special lists have to be made up, and this can be done by referring to the directories, and by getting in touch with tax commissions, real estate boards and so on.

A contractor who did nothing but contract work in a large city had to keep himself before all his possible prospects, about a thousand in all. He had the firm names, but required the names of the individuals to whom he could send his advertising. He employed a girl to phone each company name and try to get the name of the right man. She was only partly successful, and he had to finish the job himself. Until he made clear just why he wanted the name of the man, and assured the prospect it was to their interest to furnish such names, he made little headway. It cost him over five cents a call, plus his time, to get this list, but he figures that it prevented the waste of hundreds of dollars worth of literature.

To Interest and Follow-Up Prospects

Having planned your campaign, outlined the telephone approach, and decided just how the salesmen and demonstrators will use the telephone, as well as the operator in the office (so that there may be no conflict of calls) you are ready to go ahead. Let us take a case where the operator's job is to pave the way for the salesman's visit, working the residential section to sell an electrical washer or cleaner. In this case the operator telephones prospects in a certain district in advance of the man, who at intervals gets from her a report on the people she's talked to in that locality. She may explain to Mrs. Housewife that their man is going to be in the vicinity that afternoon, and "would she permit the man to drop in and show her the new, wonderful Blank washer or cleaner? If the telephone appeal is at all good, she will secure the following results: a certain number of affirmatives where the salesman may call at a specified hour; some where the prospect will agree to visit the store at a certain time; others who will agree to see the salesman, or to come in at some future date, and lastly a certain percentage who will profess indifference and must be thrown out. A certain number of failures, or "let downs" must be expected. The

better the telephone solicitation the better the results, the more calls for the salesman or demonstrator—the easier he can sell. Some dealers make it a point to have their salesmen call on prospects who show indifference anyway, merely stating to the housewife that they know she said she wasn't interested, but they felt she had not forgotten the idea in her mind, that if she'd give them just three minutes they could convince her to the contrary.

The telephone should be used judiciously for following up prospects, after the man has called. Many dealers have the man himself telephone within a certain time after his call, especially where he has made any demonstrations, or left an appliance on trial. He inquires of the prospect how the operation of the device suited, and gets a line on when he should make his personal, follow-up visit. In many large companies salesmen desire to be relieved of all the burden of telephoning that is possible, and the girl operator is entrusted with this work. If, for any reason, the prospect is dissatisfied with the salesman, it is wise to delegate the task of following up, and the closing of the order to someone else.

Particularly in campaigns where appliances are placed on trial for a certain definite period, the telephone follow-up comes in handy. Very often the prospect has not had time to try the device and it is a good plan to telephone before going out to remove it, to explain to her that if she has not had time to use it, "just as an accommodation to her" she may keep it a day or more longer.

To Develop Business From Customers

Few merchandisers think to use the telephone to get more business from old trade. The butcher, the grocer, the baker occasionally uses this means of increasing his business, but most electrical dealers have believed that since the appliance is not a "staple," hence the average family does

not "repeat" on it, they could not increase their business from customers. Nevertheless there are electrical dealers who do figure each customer as a potential prospect for \$150 worth of business, and as soon as they order one device they go after them for another. It is necessary to keep good records of what the customer has bought. It must be remembered that once a customer, the heaviest part of selling has been done—the introductory effort has been accomplished, and it is just so much easier to sell additional goods.

One dealer last spring sold hundreds of fans by simply calling up his customers and telling them that there was going to be a fan shortage, and he felt they ought to know about it, and order now, even if they didn't want their fan until later. He laid away fans for people who did not care to have immediate delivery. Incidentally he secured a large amount of repair business from people who decided to have their old equipment overhauled before the repair rush set in. Another dealer has a list of motor customers; he keeps careful records of when his customers may be in the market for re-orders and for maintenance and repair service. He uses nothing but the telephone to keep in touch with his trade. Still another telephones his customers about twice a year asking how the device he sold is working, and leading the conversation into such channels as this: "Mrs. Smith—it just occurs to me—do you know if Mrs. Blank, across the street does her washing electrically? I heard she was considering an electric washer, and I thought you might know." (Usually he gets a line on how his customer's neighbors does it.) Occasionally this dealer has offered his prospects a commission on any live prospect they turned over to him. He uses the telephone to let people know of this plan.

To Facilitate Collections

Business men are more familiar with the use of the telephone in this connection. There are many things which can

Second Call to All Electrical Men

Manufacturers, Jobbers, Central Station and Power Plant Men, Wholesalers,
Salesmen, Contractor Dealers and all Members of the
Electrical Industry

You are invited to come to the GIGANTIC ELECTRICAL CONVENTION

To be held in the CITY OF VANCOUVER

May 26th and 27th Next.

The Chief Speakers will be
W. L. GOODWIN and **SAMUEL A. CHASE**
Author of the Goodwin Plan
and in all probability
SENATOR NICHOLLS, President Canadian General Electric Co.

All meetings will be open. You cannot afford to be absent from the greatest electrical gathering ever held in Western Canada.

Special arrangements will be made for the entertainment of the wives of the visitors.

Be sure to get on the mailing list. Write the Secretary, 406 Yorkshire Bldg., Vancouver, B. C.

be said over the telephone but would be unwise to put into a letter; yet there are times when those things should be said. In making collection it is wise to have this work done by the proprietor himself, or some one in authority within the organization.

To Adjust Complaints

Failure to make good on deliveries, deficiencies in the service, and other slip-ups in the merchandising scheme should have prompt and careful attention. But not enough companies go the limit in making good with customers. After the error has been rectified, it is a good plan to call up the party complaining and make sure they are satisfied. People who call up to make complaints do not want to make them to clerks, or operators; they want the attention of somebody in authority. Larger stores and companies have "Adjustment Bureaus" which handle all complaints. But it should be the rule to adjust complaints at once wherever possible. The telephone supplies adequate opportunity for "locating the customer to it;" should an error be discovered in delivery, for example, the customer should be telephoned before he or she has had time to send in any complaint.

The plain is the thing. Plan your telephone campaign, then work your plan. Re-shape, re-build it as you have to, as you go along, but don't be discouraged if you don't get great results at once. Profit by your mistakes—try again.

Illuminating Engineering Society

The Toronto members of the Illuminating Engineering Society were treated to an illustrated lecture on "Store Lighting" by Mr. C. C. Bothwell, at 8 p.m., April 8th, in the assembly room of the Toronto Hydro-electric System's sub-station, southeast corner of Nelson and Duncan Streets. There were sixty-five interesting slides illustrating good and bad samples of lighting conditions throughout America. There was a good attendance and the members spent a most profitable evening.

Annual Meeting of National Association

The preliminary arrangements for the coming annual meeting of the National Association of Electrical Contractors and Dealers have just been completed. The convention will be held in Milwaukee, Wisconsin. The executive committee of the association will meet in the city on July 14 and 15, while the convention meetings will be July 16, 17 and 18. The headquarters of the convention will be at the Hotel Pfister.

Who's Fault Is It?

A new small house in one of the best residential districts in Toronto is on sale at the present time, the value being somewhere around eight thousand dollars.

There is one base plug in this house which the owner makes special mention of to all prospective customers. He invariably arranges a special trip back to the room containing this plug so as to properly impress his customer with this luxurious appointment. Frequently he is asked: "Why didn't you put one here, and here, and here?"—to which he replies: "Oh, no one ever puts in more than one."

Who will say that this is not the regular attitude of both the house-builder and the architect? We almost said the contractor, too. But in any case the contractor is to blame to a considerable extent for he knows the lamentable ignorance of the architect about these matters and ought to be trying harder to educate him. On the other hand the architect, after all, cannot be greatly blamed for no one ever pays much attention to his electrical specifications.

It is a lamentable fact that even the best houses are not

being properly equipped electrically. How can we ever expect to sell appliances if we don't make provision for their use?

How I Increased My Sales 100 Per Cent.

By Mr. E. Brettell*

Last fall we purchased a number of Emeraldite bed lamps fitted with the Wirt Dim-a-lite socket. We also had in stock a number of the well-known Little Wizard lamps. For a few weeks these lamps remained on display in our store, from time to time being placed in our show windows with other portable lamps, but we were very disappointed in the sale of both lamps.

One day, however, when we were devising means of pushing the sale of these particular lamps, one of us hit upon an idea and the result was extraordinary; this is what happened:

We borrowed an attractive bed and mattress from the Hudsons' Bay Company, nearby, and with the addition of sheets, blankets, pillows, etc., we put a display in our windows which contained nothing but this nicely made-up bed in which was reposing a large doll—which, by the way, was reading a booklet issued by us, entitled "Electrical Home Needs." To the rails of the bed above the doll's head were attached two of the lamps aforementioned, and a large card rested on the bed with the words "DO YOU READ IN BED?"

The result of this display was astounding. The lamps sold readily, and so great was the demand that our stock was exhausted and we had to wire the factory for a rush shipment. Although that display was in our window six months ago we are still selling these lamps to customers who remember noticing it as they passed.

[This bears out what Mr. Corcoran said in his address before the Toronto contractors. He told of a man who, after a good deal of hesitation consented to take one washing machine on trial from a certain manufacturer. Feeling that he would have it on his hands for some time he determined to give a washing machine display in his window, with the result that he sold the machine before he had time to complete his display. Mr. Corcoran also told of a certain store in New York that consistently displayed and demonstrated fans in the window last year, with the result that this store was always sending in repeat orders for more fans, while the other stores were complaining of slow sales.]

This is just another case where the electrical dealer must profit by the experience of merchandisers in other lines of trade. The slogan of the shoeman, the haberdasher, and the grocer, is: "Put your window on your sales staff." What is the secret of the success of the Italian as a fruiterer? Surely it is effective window display. Think of the thousands of people who stroll down town evenings to see the department store windows—changed every day or two.

And remember too—there is nothing that makes a more attractive showing in a window than electrical goods, nothing that lends itself so readily to making an appeal to the popular attention. Don't delay longer—make your window a member of your selling staff from now on and see to it that, like the other members of your staff, it is clean, neat and carefully and attractively dressed.—Editor].

Weather-proof Condulets—Catalog No. 1000-J, by the Crouse-Hinds Company of Canada, describing weather-proof condulets for switches and plug receptacles. This is a supplement to Condulet Catalog No. 1000; well illustrated. The same company have issued Condulet Suggestion No. 14, showing conduit and condulets used on direct motor-driven machinery.

*Electric Supply and Contracting Company, Vancouver, President Vancouver Association Electrical Contractors and Dealers.

MR. BUSINESS MAN! ARE YOU TREATING YOUR WIFE RIGHT?

Jim Blank sat in his office chair,
Manager, clerks, and all were there.
Blank ran his business for gain and not fun;
Work-saving aids, a thousand and one.
Were used—for of obsolete methods there really were
none.
And that was Jim Blank—he'd rave and he'd cuss
Unless he could have efficiency plus:
Time-saving methods—devices electric—
Jim Blank would have or he'd turn apoplectic.
He ran his whole office on just such a plan,
Because—well, because he was that sort of man!

At home, though, Jim Blank
Was a crusty old crank,
And on old-fashioned methods of working he'd bank.
His wife—sad her plight—
From morning 'til night
She'd work and she'd work, which wasn't quite right.
"I want," she would say,
To Blank, ev'ry day,
"Some electrical things—
Then the work would take wings:
My maid is so peevish I fear we can't keep her.
Why don't you bring home an electrical sweeper?
If you run your office helped out by the ohm,
Why not give your wife the same help in your home?"

But Jim couldn't see it. He went off to bed
And he dreamed such a dream that he wished he were
dead.
He dreamed the whole household had sauntered away,
And left him alone for a week and a day.
There was washing and ironing and sweeping galore;
Sewing to do—and meals by the score;
Up and down stairs ev'ry second he tore,
Answering the phone and op'ning the door;
And, had he the time, he'd have sat down and swore!
He thought of the office, but in between wishes
He had to bend over and wash up the dishes!
Between you and me I think you'll agree
Jim Blank had a dream that was no jubilee!

Next day, at about, say, a quarter of, four
(Though, maybe, three-thirty—or a trifle before),
There drove up a wagon,
Its very sides saggin'
As if the old thing had a wonderful jag on,
And left at Jim's door a gift to his wife.
Such helpmates she never had known in her life—
Electrical helpers, and irons, and such,

Cleaners and washers that start at a touch,
And keep human beings from working too much!

There's a moral that's hidden somewhere in this jingle,
That applies to the married man more than the single;
The chap at his office who daily will fuss,
Unless he is getting efficiency plus,
Often forgets that his home's in a muss!

Give electrical help—then the wife will be cheerier.
And even Blue Monday won't give her hysteria!

"DO IT ELECTRICALLY"

Electric Supply & Contracting Co., Limited

(THE OLD ESTABLISHED FIRM)

781 GRANVILLE STREET (NEAR ORPHEUM) VANCOUVER, B. C.

A good advertising blotter distributed by Mr. Brettell's firm, the Electric Supply & Contracting Co., Ltd.

Western Men Are Back of the Big Vancouver Meeting

Mr. E. Brettell, President of the Vancouver Association of Electrical Contractors & Dealers, advises that electrical men throughout the west are backing up the idea of a gigantic electrical convention in Vancouver on May 26 and 27 very enthusiastically. Prominent mention has been made of the convention plans in recent issues of the Electrical News. A further announcement appears in this issue. Mr. Brettell also sent us along a couple of typical letters of a number he is receiving, promising support of the movement. One of these from Mr. Streb, The Electric Shop, Saskatoon, runs as follows:—

"Your communication inviting us to the Electrical Convention to be held in your city on May 26th and 27th next received. We are indeed glad to know that someone in this western country is starting the ball rolling in the interests of the contractor-dealers, as much is to be done and much can be done by the co-operation of all interested. If it is at all possible to get away at that time myself and Mrs. Streb expect to be with you."

Another from Mr. Shortt, Manager Light & Power Company, Cumberland, B.C., says:

"Your kind invitation to be present at the Electrical Con-

vention to be held on May 26th and 27th in your city reached me to-day. To hear Mr. Goodwin would indeed be a treat in itself. Mrs. Shortt and myself expect to be with you."

This is the kind of support Mr. Brettell and his executive are looking for. If you haven't told him yet, sit right down to-day and write "I'll be with you. What can I do in the meantime?"

Hamilton Electrical Association is Active

On Monday, March 31st, the Hamilton District Electrical Association held a meeting at the Royal Connaught Hotel, Hamilton. A large number of members and visitors were present to hear an address from Mr. L. B. Chubbuck, of the Canadian Westinghouse Company, Hamilton, on auto-starters, auto-transformers and overload relay coils. In view of the fact that overload relays are being used extensively, this address was very interesting and instructive. Samples were shown, with lantern slides. A number of visitors were present from the surrounding districts, even as far as Preston. Applications are being received continually for membership in the association. It is safe to say that few lecturers have proven more interesting to the association. Local 105 of the I.B.E.W. were largely represented at this meeting by special invitation. Mr. V. K. Stalford, president, occupied the chair.

OPEN PRICE PLAN—TORONTO DISTRICT—THE ONTARIO ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS—REPORT SHEET—FORM—MARCH 1919

Open Price Letter Form Used by Toronto Contractors

This is a reproduction of the standard letter sheet used by the Toronto district of the Ontario Association of Electrical Contractors and Dealers. Every member of the Association, when he tenders on a wiring job, sends a summary of his tender on this form to the Open Price secretary. The secretary makes duplicates, triplicates, or whatever is necessary, on the same forms and sends each man who tenders on this job a copy of the figures of every other man who tenders. The main body of the letter is for a copy of the original tender. The space at the right hand upper corner is for a summary of the figures, so that comparison of the various tenders may be readily made. The space at the left hand lower corner is filled in by the Open Price secretary and the method of delivery checked off as soon as the copy is received.

For Spring and Early Summer Heating

The season is upon us when it is too expensive and entails too much work to keep the coal furnace going, but when a little heat in the cool mornings and evenings is very neces-

A
Handsome
Glower

National Electric Heating Company, Toronto. The only size at present available, we understand, is the 660 watt, but other and larger capacities are to be turned out later; the difficulty of getting material has not yet been entirely overcome. This heater has the concentrating feature which is now so popular, as it enables one to get effective heat just where it is wanted and in a minimum of time. The appearance of this unit, full glowing, is very beautiful, especially in a darkened room when one gets the impression of a ball of fire. This glower may be attached to the ordinary lighting socket.

New Type Dossert Connector

Dossert & Company, New York, announce a new type of solderless connector for splicing small wires. It is designated as Type D Dossert two-way connector and consists of male and female threaded parts acting upon a slotted taper-

Type D, No. 8
Dossert Connector,

Type D, No. 14
Dossert Connector,

sary to our comfort. In other words it is the season for the electric heater. A new and very attractive design of the glow type is being put out by a number of Canadian manufacturers, the various units differing, of course, in certain details. One of these is shown herewith. It is manufactured by the

ed sleeve or bushing, making the splice by compression. These connectors are supplied in two sizes, No. 8 being for use on No. 8 and No. 9 wires, and No. 14, which can be used to connect Nos. 10, 12, or 14 wires as desired. Illustrations show actual size and detail.

New Benjamin Reflector and Diffusing Cap

The illustrations in Figs. 1 and 2 represent the new Benjamin Dome Reflector for Mazda "C" lamps. For this reflector the following qualities are claimed:

- (1) A durable and highly reflecting surface.
- (2) A contour which insures effective distribution for factory lighting.
- (3) A minimum of glare.

The reflector is a one-piece unit with no welded joints

Reflector for Mazda "C" Lamps

Characteristic Curve

and, therefore, no exposed edges which can corrode. The method of connecting reflector and socket to the support is very rugged. The cut in Fig. 3 shows a very efficient diffusing cup designed to fit snugly over the tip of the bulb. This cup is of opal glass and blends well with the white lining of the reflector, producing a restful and pleasing effect. This

cup is specially recommended where any trace of glare would be greatly detrimental to the work, as in sewing, engraving and similar factories; fine machine work with bright machines or metals; micrometer work, and so on.

Krantz Bulletin No. 1587

The Canadian Krantz Electric and Manufacturing Company, Limited, Toronto, are distributing Bulletin 1587, describing their complete line of safety, dead front, lightly panelboards and cabinets; also a smaller, pocket size, catalogue describing their safety type and Type B panelboards, auto lock switches, floor boxes, etc. The Canadian Krantz safety panel conforms to the latest ruling. It is noticeable that this company's circuit snap switches are of 30 amperes capacity which gives them ample copper so that they are mechanically strong and will stand the continual use which is frequently demanded of them.

Jefferson Glass Filling Big Contracts

The Jefferson Glass Company, Toronto, have closed contracts for supplying the glassware in both the Dominion Parliament Buildings, Ottawa, and the Manitoba Provincial Legislature Buildings at Winnipeg. Another large contract just taken is for the illuminating glassware required by the Halifax Housing Association for some three hundred houses. Robert Mitchell & Company are electrical contractors on the latter work.

New Safety-type Switch Boxes

The illustration below shows one of the types of switch box now being manufactured by the Canadian Drill and Electric Box Company, Limited, 1402-10 Queen St., East, Toronto, formerly the Canadian Drill and Chuck Company.

This particular box is a 30 ampere, 125 volt, double pole type, with dimensions 8 inches long by 5½ inches wide by 2½ inches deep. The company's regular stock includes a complete line from 30 amperes, 125 volts, up to and including 1,200 ampere, 600 volts, with sufficient stock on hand to ensure prompt delivery and the best of service. Mr. Harley W. Morden is general manager of the new company and Mr. G. P. Ash is president.

Motor-operated Drill Press

A quarter horsepower motor operates the drill press shown herewith, which is manufactured by the Landau Machine and Drill Press Company, of New York. The illus-

tration shows the bench type of drill press. The press comprises a driller and a multiple drilling head which houses four separate drilling spindles.

Where Harvey-Hubbell Equipment is "Made in Canada"

The Harvey Hubbell Company of Canada, Limited, have a fine new home at 7-21 Labatt Ave., Toronto, shown in the picture herewith, and it is no longer necessary to send your orders for Hubbell specialties to Bridgeport, Conn., because Mr. Mack has installed all the facilities for manufacturing in his Toronto factory and is now keeping well ahead of the demand. The writer had an opportunity of looking over the factory with Mr. Mack a few days ago and noted, with pleasure, the splendid and ample facilities for manufacture and delivery, which make this plant one of the most complete in Canada.

It is worth mentioning that this company have provided unusual facilities, in their new home, for the comfort and care of their employees, all of which helps to ensure the excellence of their product and the superiority of their service. Backed by such quality and service as the Harvey Hubbell Company of Canada supply, there should be little difficulty in establishing the "Made in Canada" label as the standard of excellence the world over.

Hospital Call Pull Switch

A new device called a "Hospital Call Switch," has just been developed by the Cutler-Hammer Manufacturing Co., Milwaukee. It is made for installation in a standard switch outlet box and the wiring does not extend beyond the box. No flexible conductors or push button switches are required for its use, consequently, the annoyance of having these parts broken and soiled is eliminated. Further, as the live parts terminate in the wall, there is no possibility of the patient coming in contact with them. From the accompanying illustration it will be seen that the new device consists of a C-H standard push and pull mechanism slightly modified. The switch is operated by pull chain. A linen cord placed within easy reach of the patient is used to pull the switch "on," the cord being attached to a short piece of chain which extends

through a horn in the plate and is attached to a projection on a push-button. A pushbutton located above the horn extends through the plate and is used by the nurse to push the switch off. The plate is the same size as those used for wall

At left, rear view of hospital call switch. At right, illustration showing linen cord which the patient uses for pulling the switch on, and button above it which the nurse uses for pushing the switch off.

switches and receptacles and the switches and the plates are made singly or in gangs. The new device may be used on any standard lighting circuit of 125 volts or less.

The General Railway Signal Company, Rochester, N.Y., have issued Bulletin 135, dated March, 1919, describing their "Absolute Permissive Block System Circuits." A number of interesting diagrams are included and fully described.

Lighting and Battery Charging Set

With the HB lighting and battery charging set, the garage that does not have electric current available from any public plant can make its own electric light and at the same time have the power necessary to handle the profitable business of recharging automobile storage batteries. The generator is a specially wound machine, 110 volts, direct

current, speed 1800 r.p.m., weight 300 pounds. It operates from line shaft or engine, requiring 4 h.p. at full load. It supplies ample capacity for brilliant lights at low cost, and it will recharge at one time from one to six 6-volt auto storage batteries or their equivalent. The HB lighting and battery charging set is furnished complete in every respect, ready to belt to engine and operate. It includes generator, base tracks, field rheostat, charging panel, and pulley with 6-inch diameter and 4-inch face. No switchboard is necessary. Made and sold by Hobart Brothers Company, Troy, Ohio.

Electrically Operated Portable Bench Saw

The portable bench saw illustrated below is manufactured by the J. D. Wallace Company of Chicago. It is equipped

with a half horsepower motor and so may be operated from an ordinary lighting socket. In addition to being easily port-

able, this saw has an added feature which would be impossible with any but electric motor drive, viz., it can be tilted at any angle—the motor being direct connected to the saw and both mounted on an arbor which swings as you operate the hand wheel. It is claimed that by the use of this electrically operated saw, operating costs in woodworking and similar factories can be greatly reduced.

A New O. B. Catalogue

The Ohio Brass Company, Mansfield, Ohio, have issued Catalogue No. 17 covering high tension porcelain insulators; overhead materials; rail bonds; car equipment, etc. This is a wonderfully complete catalogue of 650 pages, splendidly illustrated, containing a fund of information of particular interest to electric railway men. The catalogue is thumb-indexed under the following headings: Porcelain Insulators; Miscellaneous Pole Hardware; Trolley Materials; Catenary Materials; Bonds and Tools; Third Rail Insulators; Car Equipment; Tables.

Personal

Mr. Charles Duncan, of the Duncan Electrical Company, Montreal, is spending a holiday in the South.

Mr. Sam. A. Gaskell, Toronto, manager Lancashire Dynamo and Motor Company, sailed for England on April 10.

Captain F. D. Burpee, of Ottawa, has returned from three years' service overseas and resumed as superintendent of the Ottawa Electric Railway.

Mr. Frank A. Pumple, manager of the Eastern Electric Company, St. John, N.B., has resigned to join the Canadian General Electric Company, who are opening a St. John branch, with Mr. Pumple as manager.

Mr. Alexander Smith, of Chicago, has been elected a director of the Abitibi Power and Paper Company, replacing Mr. E. M. Mills, of Chicago, whose resignation was tendered during the last year.

Mr. Arthur Hilliard Foster, B.A.Sc., has been appointed manager of the Brantford Municipal Electric Railway. He is a graduate of the Faculty of Applied Science, University of Toronto, and has had considerable experience in railway work.

Mr. W. A. Black, vice-president and managing director of the Ogilvie Flour Mills Company, has been elected to the directorate of the Abitibi Power and Paper Company, filling the vacancy created by the resignation some months ago of Hon. Geo. Gordon, of North Bay.

At the annual meeting of the Canadian Westinghouse Company held recently, officers and directors were elected as follows: Directors:—Messrs. H. H. Westinghouse, Paul J. Myler, L. A. Osborne, Thos. Ahearn, Sir John M. Gibson, John F. Miller, F. A. Merrick, Warren Y. Soper, Charles A. Terry and Gen. Guy E. Tripp. Officers:—Messrs. H. H. Westinghouse, Chairman; Paul J. Myler, President; L. A. Osborne, Vice-President; F. A. Merrick, Vice-President and General Manager; W. E. Sprague, Secretary; Geo. R. Kerr, Treasurer; N. S. Braden, manager of sales; H. M. Bostwick, assistant manager of sales; C. H. O. Pook, manager of works.

An amendment to the Public Utilities Bill in the British Columbia Legislature, providing that the agreement between the B. C. Electric Company and the city of Vancouver authorizing a six cent fare would be terminated when the Public Utilities Act went into effect, failed to carry and the six cent fare still maintains. The idea was that the whole matter would have to be threshed out again before the Public Utilities Commission.

SALE OF Surplus Military and Naval Stores

**Dry Goods, Camp Supplies,
Food, Hardware, Scrap
Metal and Junk**

Cloth; new and second-hand clothing, equipment, hardware, tents, blankets, camp supplies, etc. : : Flour, jam, canned evaporated milk, tea, coffee, etc. : : Condemned clothing, junk, old brass, metals, leather, rubber, etc.

Sales will be made by Sealed Tender

Persons desiring to tender are requested to communicate with **THE SECRETARY OF THE WAR PURCHASING COMMISSION, BOOTH BUILDING, OTTAWA**, stating the items in which they are interested, whether new or second-hand or both.

Arrangements will be made to have samples on exhibition at places throughout Canada; specifications, full details, and tender forms will be mailed when ready to those who have registered as suggested above.

If Interested Please Apply Now

Institutions May Make Direct Purchase Without Tender

Dominion, Provincial, and Municipal departments, hospitals, charitable, philanthropic, and similar institutions which are conducted for the benefit of the public and not for profit may purchase goods without tender at prices established by the War Purchasing Commission.

All communications should be addressed to the Secretary, War Purchasing Commission, Booth Building, Ottawa, who will be glad to supply lists and further details to those interested.

Current News and Notes

Arnprior, Ont.

The Galetta Electric Power Company, of Galetta, Ont., contemplate extending their line to Arnprior, Ont., and estimates are being prepared.

Bounty, Sask.

The village council of Bounty, Sask., contemplate the installation of an electric lighting plant.

Brantford, Ont.

New switching equipment is being installed at the Brantford hydro-electric sub-station.

The annual statement of the Brantford Hydro-electric Commission shows total earnings of \$114,362.39, with a gross surplus of \$28,666.75, as compared with \$25,938.40 in 1917, and a net surplus of \$18,586.75 after allowing depreciation of \$10,080.

Broderick, Sask.

The village council of Broderick, Sask., have under consideration the installation of a plant to supply electric light to the village.

Burns Lake, B.C.

Messrs. F. R. Keefe and Charles Wallace propose erecting a dam on the Stellace River, near Burns Lake, B.C., and using the power produced to operate a large mill, construction on which will be commenced very soon.

Clark's Harbor, N.S.

It is reported that the town council at Clark's Harbor, N.S., are considering the installation of a small electric lighting plant.

Guelph, Ont.

A delegation from Elora, Ont., recently visited Guelph regarding a proposed extension of the electric railway from Hespeler north to Mount Forest by way of Guelph. Elora is anxious to have connection with Guelph and is willing to guarantee bonds covering cost of the extension. The line to Hespeler would be operated by the C. P. R. as an extension of their Galt to Hespeler branch.

The Wendigo Power Company, Limited, Guelph, Ont., has been granted letters patent "to carry on the business of an electric light, heat and power company in all its branches." The capital stock is \$1,000,000.

Halifax, N.S.

At the annual meeting of the shareholders of the Nova Scotia Tramways and Power Company, March 31, all the old members except Mr. H. R. Mallison, went off the board of directors. A new board representing largely the Boston interests in the company was elected. The new board is as follows:—W. H. Covert, K.C., Halifax; H. R. Mallison, Halifax; F. B. Adams, New York; F. P. Boyce, Boston; M. L. Sperry, Boston; L. B. Buchanan, Boston; W. C. Crawford, Boston; M. M. Phinney, Boston; Royce Ernst, Boston. The directors will meet later on to elect a president.

Kenora, Ont.

The town council of Kenora, Ont., have ordered 500 meters from the Canadian Westinghouse Company which will be installed in all premises now using current on the flat rate.

London, Ont.

The city council of London, Ont., after nearly a year's controversy, have agreed to grant an increase in fares to the London Street Railway and to make application to the Ontario Legislature for validation of the necessary amendments in the company's franchise. The company will be empowered to charge a five cent cash fare; six tickets for a

quarter, good at any time. The company at present charge five cents cash, but strips are sold of seven and nine for a quarter. The new rate will be six and seven for a quarter, the latter being workmen's tickets. Another problem faced by the railway company is a demand by the employees for ten cents an hour increase.

Montreal, Que.

The Westmount Electrical Company (Geo. E. Hayes), is a recently registered company. They will carry on an electrical contracting business.

Gagnon & Dubeau, electric contractors, Montreal, Que., have registered partnership.

The Crown Electric Company (William Flood), Montreal, Que., is named among recent registrations.

The Dominion Electrical Supply Company (Henry Hamlet), Montreal, have registered.

Ottawa, Ont.

Tenders are being received until April 30 for an electric clock system, fire alarm system and annunciators for the new Dominion Parliament Buildings at Ottawa, Ont. Plans are at the office of the general contractors, P. Lyall & Sons Construction Co., Ottawa.

Port Arthur, Ont.

The Sanderson Electric Company, Limited, Port Arthur, Ont., have been granted an Ontario charter.

Regina, Sask.

Estimates for the Regina Municipal Electric Railway Department for the coming year make provision for an estimated deficit of \$22,526. The deficit last year was \$67,844 and the estimated deficit \$46,824.

St. Catharines, Ont.

Lincoln County Board of Agriculture have decided to

request the Ontario Hydro-electric Commission to use its influence with the Provincial Government to have the act amended to permit counties as well as townships and urban municipalities to purchase and distribute blocks of electric energy for lighting and power in rural constituencies.

Three Rivers, Que.

It is reported in the daily press that the Canadian Pacific Railway contemplate electrifying their branch line from Three Rivers to Shawinigan Falls and Grand'Mere, Que.

Toronto, Ont.

The Toronto Railway Company have, owing to increased operating costs, been forced to forego the usual quarterly dividend on their \$12,000,000 outstanding common stock.

The agreement between the Toronto Street Railway Company and its employees expires at the end of May, when it is anticipated the men will ask for an eight-hour day with equal, or higher than present rates of pay.

As a result of a conference of delegates from various municipalities affected and the Ontario Hydro Commission recently it has been decided by the latter body to apply to the government for permission to proceed immediately with the construction of the proposed radial railway between Toronto and Port Perry.

The A. M. Castle Engineering Company, Limited, have been granted letters patent under the Ontario Companies Act; head office Toronto, capital stock \$275,000. They are empowered to manufacture all classes of machinery, including electrical power plants.

The Excelsior Electric Company, Limited, Toronto, have obtained a charter.

Electrical Switch Boxes

Form Steel Boxes, Motor Starting Switches (^{Steel Enclosed}), Motor Drip Pans, Motor Covers, Rheostat Boxes and Accessories.

The illustration shows our new Service Box No. 1005, 30 Amp., 125 Volt, double pole, size 8" long x 5½" wide x 2½" deep.

A well made box with carrying capacity up to standard in every way and approved by Hydro Electric Commission. This box has been especially designed as a time-saver, and it can be installed in less time than any other box on the market. We will install knock-outs to suit your own requirements in any of our service equipments.

Our regular stock includes a complete line from 30 Amp. 125 volt up to and including 1200 amp. 600 volt. We have at all times from 4000 to 5000 Type E. Boxes on hand for immediate shipment insuring you the best of "Service" which is our motto.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

Electrical Books—Special Prices

The following Books are Offered Subject to Previous Sale:

"American Electricians' Handbook, a reference book for practical electrical workers, by Terrell Croft. 712 pages, with over 900 illustrations. Published by McGraw-Hill Book Co. Price \$3.00.

A Handbook on the Steam Engine, by Herman Haeder. Published in 1914 by Crosby, Lockwood & Son. 522 pages, illustrated. Price \$3.00.

A Laboratory Manual of Alternating Currents, by John H. Morecroft, E.C. Published in 1912 by Renouf Publishing Company. 248 pages, illustrated. Price \$2.00.

Baudot Printing Telegraph System, by H. W. Pendry. Published in 1913 by Whittaker & Company. 144 pages, illustrated. Price \$1.00.

"Central Stations," by Terrell Croft, 1st edition published in 1917, by McGraw-Hill Book Co., Inc. 332 pages, illustrated. Price \$2.50.

Direct-Acting Steam Pumps, by Frank F. Nickel. Published in 1915 by McGraw-Hill Book Company. 258 pages, illustrated. Price \$3.00.

Direct Current Machinery, Theory and Operation of, by Cyril M. Jansky, B.S., B.A., 1st edition, just published by McGraw-Hill Co., Inc. 285 pages, illustrated. Price \$2.50.

Dynamo-Electric Machinery, by Francis B. Crocker, E. M., Ph.D. Published in 1908 by American School of Correspondence. 236 pages, illustrated. Price \$1.00.

Electric Arcs, by Clement D. Child, Ph.D. Published in 1913 by D. Van Nostrand Company. 194 pages, illustrated. Price \$2.00.

Electric Car Maintenance, by Walter Jackson. Published in 1914 by McGraw-Hill Book Company. 274 pages, illustrated. Price \$2.00.

Electric Railway, by A. Morris Buck, M. E. Published in 1915 by McGraw-Hill Book Company, Inc. 390 pages, illustrated. Price \$3.00.

Electric Railway Engineering, by C. Francis Harding, E. E. Second Edition. Published in 1916 by McGraw-Hill Book Company. 416 pages, illustrated. Price \$3.00.

"Electric Traction," a treatise on the application of electric power to tramways and railways, by A. T. Dover. Published in 1917 by Whittaker & Co. 661 pages with 518 illustrations and five folding plates. Price \$6.00.

Electrical Injuries, by C. A. Lauffer, M.D., published in 1912 by John Wiley & Sons. 77 pages. Price 50 cents.

Electro-Dynamics, by Charles Ashley Carus-Wilson. Published in 1898 by Longmans, Green & Company. 298 pages. Price 50c.

Elementary Principles of Illumination and Artificial Lighting, by Arthur Blok, A.M.I.E.E. Published in 1914 by Scott, Greenwood & Son. 235 pages, illustrated. Price \$1.00.

Elementary Graphic Statics, by John T. Wight. Published in 1913 by Whittaker & Company. 226 pages, illustrated. Price 75c.

Elementary Magnetism and Electricity, by Cyril M. Jansky, B. S. Published in 1914 by McGraw-Hill Book Company. 212 pages, illustrated. Price \$1.50.

Examples in Alternating-Currents, (Vol. 1), by F. E. Austin, B.S. Published in 1915. 223 pages, illustrated. Price \$2.00.

Examples in Magnetism for Students of Physics and Engineering, by Prof. F. E. Austin, B. S. Published in 1916. Price \$1.00.

First Aid in Case of Electrical Shock, by Dr. John Woodman. Published in 1908 by the New York Edison Company. Illustrated. Price 50 cents.

"Fuel," by C. F. Herington, recently published by D. Van Nostrand Co. 211 pages, with 84 illustrations. Price \$3.00.

Handbook of Machine Shop Electricity, by C. E. Clewell. Published in 1916 by McGraw-Hill Book Company. 461 pages, illustrated. Price \$3.00.

How to Make High-Pressure Transformers, by Professor F. E. Austin. Second edition, just published. 48 pages, illustrated, price 65c.

"Powdered Coal as a Fuel," by C. F. Herington, recently published by D. VanNostrand Co. 211 pages with 84 illustrations. Price \$3.00.

Practical Electric Illumination, by Terrell Croft, First edition, published by the McGraw-Hill Book Co. 225 pages, illustrated. Price \$2.00.

Principles of Direct Current Machines, by Alexander S. Langsdorf, M. M. E. Published in 1915 by McGraw-Hill Book Company. 404 pages, illustrated. Price \$3.00.

Principles of Alternating Current Machinery, by Ralph R. Lawrence. Published in 1916 by McGraw-Hill Book Company. 614 pages, illustrated. Price \$4.50.

Principles of Electrical Design—D.C. and A.C. Generators, by Alfred Still. Published in 1916 by McGraw-Hill Book Co. 365 pages, illustrated. Price \$3.00.

Radiodynamics—The Wireless Control of Torpedoes and Other Mechanisms, by B. F. Miessner. Published in 1916 by D. Van Nostrand Company. 206 pages, 112 illustrations. Price \$2.00.

"Radio Communication, Theory and Methods, with an appendix on Transmission over Wires," by John Mills. First edition, just published by McGraw-Hill Book Co., Inc. 205 pages illustrated. Price \$1.75.

Radiation, Light and Illumination, by Steinmetz. Published in 1909 by McGraw-Hill Book Company. 304 pages, illustrated. Price \$2.50.

Standard Wiring, 1919 Edition, 25th Year. The National Authority on Wiring and Construction. By H. C. Cushing, Jr. Leather cover, pocket size. Price \$1.50 postpaid.

Steam Power Plants—Their Design and Construction, by Henry C. Meyer. Published by McGraw-Hill Book Company in 1903. 158 pages, illustrated. Price 50c.

Steam Turbines, by Robert M. Neilson. Published in 1903 by Longmans, Green & Company. 294 pages, illustrated. Price \$1.00.

Steam Turbines, by Kennedy. Published in 1910 by Whittaker & Company. 100 pages, illustrated. Price \$1.00.

Telegraph Practice, a Study of Comparative Method, by John Lee, M.A. Just published, by Longmans-Green & Co. 102 pages. Price \$1.00.

Telegraphy—A Detailed Exposition of the Telegraph System of the British Post Office, by T. E. Herbert, A.M. Inst. E.E. Third edition. Published in 1916 by Whittaker & Company. 985 pages, 630 illustrations. Price \$2.00.

Telegraphy, by Sir W. H. Preece, K.C.B., and Sir J. Sivewright, M.A. Published in 1905 by Longmans, Green & Company. 504 pages. Price \$1.00.

Test Methods of Steam Power Plants—A Reference Book for the Use of Power Station Engineers, Superintendents and Chemists, by Edward H. Tenney, B.A. M.E. Published in 1915 by D. Van Nostrand Company. 224 pages, 85 illustrations. Price \$2.50.

The B.I. Hand-Book, published by British Insulated & Helsby Cables, Limited. Second edition. 448 pages, illustrated. Price \$1.00.

The Electrical Contractor; Principles of Cost-Keeping and Estimating, by Louis W. Moxey, Jr. Published in 1916 by McGraw-Hill Book Company. 86 pages, illustrated. Price \$1.50.

The Dynamo (2 volumes), by Hawkins & Wallis. Published in 1909 by Whittaker & Company. Price \$4.00.

The Lighting Art, Its Practice and Possibilities, by M. Luckiesh. First edition, just published by McGraw-Hill Book Co., Inc. 229 pages, illustrated. Price \$2.50.

The School of Practical Electricity (Electrician's Course in 2 volumes). Volume 1. Published by Electroforce Publishing Company, Milwaukee, Wis. 410 pages, illustrated. Price \$4.50.

The Practical Railway Spiral, by L. C. Jordan, C.E. Published in 1913 by Van Nostrand Company. 155 pages. Price 75c.

Transmission Line Crossings, by Frank F. Fowle. Published in 1909 by D. Van Nostrand Company. 69 pages, illustrated. Price \$1.00.

Treatise on Thermodynamics, by Dr. Max Planck. Published in 1903. 272 pages. Price \$1.00.

WHITE'S PORCELAIN STRAIN INSULATORS

You want strain insulators that are strong physically, that stand up under the exceptional conditions of the heavy storm; that hold up under a load of sleet; that don't crack when the thunder rolls, the lightning flashes, and the wind whistles.

This is the kind of strains T. C. White Company is making of porcelain in a variety of sizes for different loads, and several designs for varying conditions.

It will pay you to write for bulletin which shows designs and gives the complete data on strain and electrical tests.

Write today.

Tenders Wanted for Electric Clock System, Fire Alarm System, Sessional Gong System, and Annunciators

Sealed tenders will be received by the undersigned until noon, April 30, 1919, for:—

- (1) Electric Clock System.
- (2) Fire Alarm System.
- (3) Sessional Gong System.
- (4) Annunciators.

All tenders to be based upon the manufacture, supply, delivery and installation complete of the "Electric Clock System"; and on the manufacture, supply and delivery of the "Fire Alarm System, Sessional Gong System, and Annunciators."

The work of this contract shall be proceeded with in such a way that the apparatus required for the "Fire Alarm System," for the "Sessional Gong System," and for the "Annunciators" will be delivered complete at the building within two (2) months of the signing of the contract; and the "Electric Clock System" will be completed by November 30, 1919.

Plans, specifications, and any other information required can be obtained at the office of the General Contractors, P. Lyall & Sons, Construction Company, Limited, Ottawa.

Each Tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works, for a sum not less than five per cent. (5%) of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so. If the tender is not accepted the cheque will be returned. If the tender is accepted an additional cheque for a sum equivalent to five per cent. (5%) of the tender must be deposited before the contract is signed. The total security will be forfeited if the contractor fails to complete the work contracted for.

Payment for material will be made monthly. The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked: "Tenders for Electric Clock System, Fire Alarm System, Sessional Gong System, and Annunciators," and addressed to the undersigned.

JOHN A. PEARSON, Architect.
J. O. MARCHAND, Associate.

New York's Jeweled Portal for Home Coming Soldiers

What is considered by many to be the most superb piece of decorative lighting in the history of the art, surpassing any individual effort made at the Panama Pacific International Exposition, has been erected at the corner of Fifth Avenue and Sixtieth Street, New York city, in honor of the homecoming regiments. This jeweled portal was created in the illuminating engineering laboratory of the General Electric Company at

Schenectady under the direction of Walter D'Arcy Ryan. The arch is really a gigantic curtain of jewels draped between two obelisk forms. The obelisks rise to a total height of 80 ft., and are surmounted by great jeweled forms in the shape of sunbursts 12 ft. wide and 20 ft. high. Approximately 30,000 jewels from the famous Tower of Jewels of the Panama-Pacific International Exposition are used in the gigantic curtain, and when in use beams of light from arc projectors are thrown on the arch, causing the thousands of jewels to flash the brilliant and pure colors of the spectrum. The arch was designed especially for the purpose of jeweled decoration and the effect is gorgeous.

Disposal of Obsolete and Shopworn Goods

Once or twice a year, according to the amount of goods on hand, the Philadelphia Electric Company holds an auction sale for the benefit of its employees. The articles which are sold by auction are either shopworn goods or else discarded or more or less obsolete types of electrical goods. Consequently they could not be sold to regular customers. Many of the parts cannot be supplied readily, and the goods are not so modern as other articles of the same kind that are on sale.

The articles vary from washing machines and carpet sweepers to toasters, broilers, hair curlers, lamps and lamp shades, flatirons, etc. The employees are told the exact condition of the articles and that they are discarded or obsolete types. All are in excellent repair, and where parts are missing, like cords, this fact also is stated.

No effort is made to get big prices or to obtain any profit; yet, in spite of this, some articles are sold at prices near the retail cost. Everything is done on a cash basis. Usually a hundred or more articles are placed on sale, and in most cases the bidding is spirited.

Friends of the Electrician

"ANTI-SULPHURIC" ENAMEL

The only reliable protection against the action of acid and chemical fumes.

"FERRODOR"

Rustproof elastic paint. Superior to Graphite or Red Lead. Defies all climatic conditions.

"DRIOROL"

Oil-proof Enamel. Dries quickly over greasy and oily surfaces. Not affected by lubricating or transformer oils.

"ARMOUR"

Fire-resisting paint, or colorless solution.

"ARMACELL"

Possesses the highest insulating qualities of any varnish on the market.

"OHMALINE"

Black, quick air-drying insulating composition. Also supplied for stoving, and as a solid insulating compound.

"SHAYDOLITE"

for coloring electric lamps. Used in the Royal Navy. Weather-proof. Dries rapidly.

"ARMABRON"

Bitumen protective paint, elastic, acid-resisting, weatherproof.

"JOBBER OF STANDARD ELECTRICAL SUPPLIES."

Eliminate the Waste
of Money on Com-
mutator and Arma-
ture repairs by using
the

"No Spark"

CARBON BRUSHES

A mint of money is wasted every year through the installation and use of brushes of an improper grade. With the correct grade of brush specified the commutator and armature last far longer and repairs are reduced to a minimum.

We will save you a great deal of expense and your engineer much worry by taking the responsibility of selecting the right grade of material. Send for our information sheet to-day.

DOSSERT CONNECTORS

The Superintendent of one of the largest electrical contracting firms writes us:

"The workmen have formed the habit of using Dossert Connectors for all kinds of connections and consider it a hardship if they are called upon to perform the tedious and laborious task of making a soldered joint with its attendant acid fumes, gasoline torch smoke and burned fingers."

Ask the man who makes the joint!

Renewable Fuses

For Electric Light and
Power

Always were the simplest fuses in construction on the market. The new Type "B," Form 4, has been reduced to the fewest parts—four metal parts of solid brass, a fibre shell and the fuse strip. Caps are removed by a twist of the wrist and as easily tightened, holding the fuse strip in intimate metal-to-metal contact.

Denzar Quality is Backed by Big Denzar Advertising

Denzar dealers are increasing their business every day. Canada is just beginning to start her reconstruction, rebuilding program—and lighting is an extremely important part.

This is the time to get after business on Denzar. We will help you in a big way. Let us tell you all about our method of getting business for you. Send for our dealer co-operation plan.

DENZAR

The Unit of Day Brightness

Denzar is universally recognized as the unit that gives light of day quality, without glare or distracting shadows. It utilizes the high powered rays of the Mazda C Lamp, diffuses them properly and casts a perfect light on the working plane.

Denzar can be furnished in both plain and ornamental styles, and in types and sizes for the proper illumination of offices, stores, schools, halls, public buildings, or factories.

Denzar gives the kind of illumination your customers want.

Write for Denzar literature and our co-operation plan.

Insulating Shell and Cap

Solderless Connection

Patented Canada 1917.
Patent Pending U. S.
and Foreign countries.

When the Inspector Sees a Walger Connection, He is Satisfied

WALGER Insulated Wire Connector

He knows it is right. It has none of the uncertainty of solder, and there is no chance of a botch job. Satisfactory inspection is always the result where a Walger Connector is used. And the connection is made so quickly—just the turning of a screw with a screwdriver, and it is done in about one-fifth of the time it takes to do it with the old blow-torch method.

No mess, no dirty marks left behind, no damage done to property. You can imagine how the Walger Connector saves annoyance and money—what it will save you.

Approved by Underwriters' Laboratories, Chicago, and Hydro-Electric Power Commission, Ontario, Canada, for No. 12 wire and under. Ask your jobber for prices and discounts or write.

World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

In our Toronto Shop we have 3 Lincoln Arc Welders and can handle electric arc welding in the shop or outside even where no supply current is available.

The ECONOMY is the pioneer that opened up the renewable fuse field. This is the fuse with the incomparable renewal element—the "Drop Out" Link.

An inexpensive "Drop Out" Renewal Link restores a blown Economy Fuse to its original efficiency. It does away with the need of powdered filler. Even a novice can replace the link and renew the fuse in a jiffy.

ECONOMY renewable FUSES and "Drop Out" Renewal Links

are used in thousands of plants, large and small, representing all branches of industry. Their efficiency and economy have been proved over and over. They are uniformly accurate in rating. As compared with the use of one-time fuses, they cut annual fuse maintenance costs 80 per cent.

In the course of a year the average plant runs up a considerable bill on fuses. The economy effected by the Economy Fuse is worthy of your notice. A comparative fuse test will quickly convince you of this, as it has innumerable others.

A Lost Opportunity

As a wiring contractor, how many times have you turned down orders to repair the Motors or dynamos of your customers and let them send their work to the maker?

How much have YOU lost in prestige through not being able to take care of your customers' business?

How much have YOU lost in Profit on this business?

Get the habit of handling these repairs. Send them to a Specialist in Repairs. Don't send them to the maker. Your customer can do that, and he's already sick of it. The service is too slow. He wants quick work and an absolutely reliable job. You can give it to him.

Make up your mind now. Say "I'm going to get something out of the next repair job in this town."

You have the work of taking out and re-installing the machine (Profit). Send us the machine or part with a description of its action or symptom. We'll rush it through for you, give you an A1 job and you come in again on the Trade Discount (More Profit).

Others are doing it. Why not you? Write about it.

The Best Known Cable Reel in Canada

In Halifax or Vancouver, whether on the public thoroughfares of our larger cities or smaller towns, wherever there is a cable installation in progress, the reels invariably bear the name of the Northern Electric Company, Limited.

The installation may be overhead, underground or submarine. It may be for a Telephone Company, a Telegraph Company, a Railroad Company, or for a street lighting system.

The quality, both of the product and the service, is largely the reason for the universal demand for Wires and Cables of Northern Electric manufacture.

HUGHES Electric Ranges and Water Heaters

From Coast to Coast during the month of June we are advertising HUGHES Cooking and Heating Devices.

The Canadian people are demanding the Electric Range. We are helping create that demand.

Of course, Mr. Dealer, you are going to grasp this opportunity to increase your revenue by joining this Dominion-wide campaign on Canada's most popular Electric Range—"THE HUGHES." Manufactured in the only factory in Canada producing a complete line, from the large Hotel to Bakery Type equipment down to the Kitchenette size—a Range to meet each and every requirement.

Cooking by electricity is the most scientifically correct and ideal method known to-day—food is perfectly cooked and more nutritious, supreme cleanliness, economical in time and money. No one once using will ever return to other methods.

Sell yourself the idea, your Customer already has it. We are placing this Idea before one and one-half million prospective customers.

Your proportion of the results is how much?

You will find your answer at our nearest Local House. Don't delay. Obtain it at once.

A Comparison

Sherardizing Steel & Creosoting Wood

The Purchasing Agent for one of the largest Hydro-Electric Power Companies, upon having the Sherardizing Process thoroughly explained to him, remarked:

"Then Sherardizing, as a method of protecting steel, is like creosoting for protecting wood."

He has since insisted upon the delivery of SHERARDUCT on all conduit orders.

The two processes are markedly similar, both in treatment and results attained. SHERARDUCT is the only Sherardized Rigid Steel Conduit. Both interior and exterior surfaces are Sherardized and further protected by coatings of a clear acid- and alkali-proof enamel, baked on. Has the combined advantages of zinc and enamel protection. Double value for one price. We can't tell you all about it here; write for complete information.

Lightning Flashes
*may instantly burn
 out your apparatus
 if not protected
 with—*

Garton-Daniels Lightning Arresters

In nearly every station, on nearly all lines, you find the Garton-Daniels—the one type of lightning arrester that has remained unchanged in principle through more than a quarter century of service.

Think of it! For over 25 years they have been protecting many millions of dollars' worth of electrical apparatus.

And they have been doing it right, because their small air-gap distance, low series resistance and positive mechanical circuit breaker form a combination which is the most efficient and reliable lightning protective unit known.

And right now, before lightning flashes actually interrupt your service and probably burn out some apparatus, it is indeed the time to consider lightning protection and buy sufficient Garton-Daniels Lightning Arresters to protect all of your apparatus.

Salesmakers for Salesmen→

Benjamin Two-Way Plug Advertising

EVERY salesman who is striving to increase his sales appreciates advertising co-operation. He appreciates even more a merchandising idea that has a real power to increase his sales of a product. This year's plans for advertising and merchandising the Benjamin Two-Way Plug mean easier and larger orders.

For instance—customers of all sizes and localities will respond quickly to the new self-selling "3 for \$3.50" display car-

Ben

and Merchandising Plans

ton. They will recognize the merits of the bigger, better campaign that is not only going to push Two-Way Plugs, but is planned to make the Benjamin Name a household word. Newspapers all over Canada will soon be emphasising to the public the reasons why they **need** and should **insist** on **Benjamin Products**.

In addition there are display stands, folders, envelope stuffers, stickers and other sales helps, all sup-

plied free of charge for use in your store and distribution to your customers.

To merchants and salesmen—You can make profit out of this campaign for bigger sales by actively connecting-up with our programme.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance.
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Be the Master of Your Own Business!

LACO lamp contracts are not iron-clad complicated agreements limiting your sales initiative. They do not require you to build up our business at your expense. Our aim is to co-operate with you in gaining profit and prestige to our mutual benefit.

WE make no attempt to finance your business. You are trading independently, on your own capital. You buy your LACO stock—we presume you will handle it with the same business judgment that has prompted you to want LACO in your store. We hold no whip-hand over you, once you have bought the goods—we ask no more than we give.

YOUR order for LACO lamps is a definite business transaction—you order what you require, not only as judged from your own past experience, but what you need, as you need it, and when you need it.

Your order is filled according to your wishes alone.

**A Square Deal to YOU—to your CUSTOMER—
to our JOBBERS—and to OURSELVES**

Back of it all is the unsurpassed LACO guarantee, that protects you and benefits us all.

The business you build in LACO LAMPS is yours to hold. Make no mistake—

Canadian General Electric Edison Mazda, the Lamp that has Upset Old Lighting Traditions.

In the past there was a limit to the light that could be bought at a practical cost. Many a factory executive has tried to be satisfied with illumination which fell far short of what he knew to be required—because he thought it the best he could “afford.”

The Edison Mazda C Lamp in one stroke blotted out half the cost of lighting. It made “raw” light so cheap that, for the first time, even the smallest plant could turn its attention to getting the kind and quality of illumination best suited to its needs.

The result has been that in the past few years we have seen a revolution in factory lighting methods. Today it is quite possible to employ a precision in the control of light that few who have not followed this advance are able to realize. Right now is the important time to make a survey of your needs. Should you desire the services of our Lighting Engineers in studying your requirements get in touch immediately with any agent handling Edison Mazda Lamps.

Lamps for the Factory, the Home and the Automobile.

The Edison Mazda Booklet “Edison Mazda Means Electric Light for Everybody” can be secured from your Dealer, or is sent gladly upon request.

Last year this Company paid out in wages over five million dollars. This large sum paid to Canadian work-people was spent in our own country and thereby every class of the community was benefited to a greater or lesser extent. It costs no more, and often much less to buy Canadian made goods, and in that manner keep Canadian money circulating in our own country instead of sending it abroad for the benefit of labor in a foreign country.

BANFIELD LIGHTING FIXTURES

Your Customers Want These Fixtures

Banfield Fixtures are a medium-grade line which have the artistic appearance of the much more costly goods.

It is the line that has the popular appeal among working and middle-class people who want attractive dependable lighting fixtures at moderate prices.

DEALERS---You Want These Profits

Banfield Lighting Fixtures offer to Canadian Dealers a complete range of Electric Lighting Fixtures selling at prices that appeal to the vast majority of your customers. This means that Banfield Fixtures "turn over" quicker than any others you can sell. Our discounts allow our dealers to fix a selling price that gives a good substantial profit.

We Want Your Business

We carry a big stock ready for immediate shipment to our dealers at all times. This absolutely guarantees you against loss through shipping delays. All fixtures are individually boxed, which makes them easy to handle, neat for stocking, as well as securely preserving the finish.

Get Our Handy New Pocket Size Catalogue

and find out about this popular line. It shows he' range of designs and gives complete information about each fixture. It will be sent free to you at once.

Write for it to-day, so you can cash in on the big demand occasioned by the building activity now going on in every part of the country.

Reasons for R & M Fan Reliability

Reason Four--- The Frame

The motor frame and base of the Robbins & Myers Fan are made of drawn steel which is extra heavy— $\frac{3}{32}$ of an inch in thickness—making the frame of the fan stronger and more rigid than the heavy cast iron type of frame.

The drawn steel construction makes the fans very light in weight, easy to

handle and effects a saving in transportation expense. The drawn steel also has a smooth surface and takes a flawless, glossy finish, which together with the graceful lines of the parts, makes the fans very pleasing to the eye. Their appearance suggests to the customer the quality built into the fans and makes easy sales for the dealer.

No 9

A Canadian Institute of Electrical Engineers?

A committee of the Toronto branch of the American Institute of Electrical Engineers is working on a report regarding the formation of a Canadian Institute of Electrical Engineers, to remain in affiliation with the parent body. As an alternative it is suggested that electrical engineers should form sub-branches in the various towns and cities and affiliate with the branches, in those towns, of the Engineering Institute of Canada.

There are undoubtedly arguments in favor of both courses and certain advantages to be gained. Affiliation with the E. I. C. offers the advantage of numbers and would enable this organization to build a stronger financial foundation. On the other hand the connection with the A. I. E. E. and the monthly proceedings are something no Canadian member would for a moment consider shutting himself off from.

After all the whole question seems to resolve itself into whether the members of the A. I. E. E. shall remain "electrical engineers" or whether they shall lose their identity in the bigger organization and become just "engineers." This latter would be a considerable sacrifice and it is not plain that there is a sufficient compensating gain. The big argument of those who favor affiliation with the E. I. C. is that "there's strength in numbers." This is true, of course, but is it not also true that the strength of two organizations of (say) two thousand members each is just as great as that of one single organization of four thousand members?

It is a momentous question that ought not to be decided on a snap vote. Also it is surely unwise to resort to threats of coercion as were suggested recently. Let us carefully place on opposite sides of the ledger the advantages of each that the other does not offer and balance up. That will be our endeavor in a future issue and readers are asked to co-operate.

Alberta Electrical Engineers Have Organized

At an enthusiastic and well attended meeting held in Edmonton on March 31st, it was resolved to form an electrical association to be known as the Alberta Association of Electrical Engineers. At this meeting by-laws and a constitution which had previously been drawn up, were adopted and an executive consisting of the following gentlemen appointed:

Chairman Northern Division, A. W. Ormsby, City Commissioner.

Vice-chairman, A. J. Cantin, Dominion government electricity inspector.

Secretary, W. J. Murphy, assistant superintendent Light and Power.

Bert L. Perry, electrical engineer and contractor.

R. B. Baxter, plant superintendent Alberta Government Telephone.

J. E. Lowry, superintendent city telephone system.

The constitution contemplates an all-provincial association with a Northern and Southern division, the headquarters of the Northern division to be at Edmonton and the Southern division at Calgary. The constitution is modelled along the lines of those of the American Institute of Electrical Engineers and allows for associates, members and honorary members.

It is not yet decided whether they will ask permission from the American body to form a local section or will retain their own identity as a provincial organization. However, in the event of allying with the U. S. body, very few changes in the by-laws and constitution would be necessary.

Article 2 of the constitution is explanatory of the objects of the association and is as follows:

"Among the objects of the association shall be the advance of electric engineering practice throughout the province. The standardization of all types of electrical plant construction. A common and uniform system of accounting in connection with the operation and maintenance of all electrical utilities. The maintenance of a high standard of professional ability among its members and by establishing such rules and regulations of the association pertaining to the construction, operation, and maintenance of electrical plant, throughout the province that they shall be considered authoritative.

"Toward this end meetings shall be held for the reading and discussion of professional papers and to take such other action which will result in the betterment of conditions pertaining to electrical industries throughout the province of Alberta."

It was stated by the members who attended this meeting that the necessity for the electrical engineering society had been apparent for some time and that judging by the success of the meetings held up to the present, the future of the A.A.E.E. is already assured. From returns to date it is believed up, and with the switch blades also in that position. To members in the Northern Division by the end of the year.

The Southern Section is in process of organization and should be completed at an early date. The executive of both divisions will form the Board of Directors for the province.

Telephone Business in Canada Grows

Statistics relative to telephone and telegraph companies doing business in Canada, covering the year which closed on June 30th, 1918, with comparative figures for the previous twelve months, were tabled in the House of Commons recently by the Minister of Railways. A substantial development of the telephone business is noted. The number of reporting companies increased from 1,695 in 1917 to 2,007 in 1918.

The growth was greater in Saskatchewan than in any other province. The number of reporting units by provinces were as follows: Prince Edward Island, 32; Nova Scotia, 143; New Brunswick, 31; Quebec, 173; Ontario, 528; Manitoba, 308; Saskatchewan, 727; Alberta, 8; British Columbia, 14; Yukon, 1.

It is noted that the governments of Alberta and Manitoba own practically all of the telephone systems in the two provinces. Saskatchewan is also a large owner of telephones, but there are, in addition, in that province, about 1,000 lines in the hands of private organizations.

The capitalization of telephone companies operating in Canada is given as \$85,274,691, and the cost as \$104,368,627, an increase of \$10,000,000, as compared with 1917.

Earnings of the telephone companies in the last twelve months under review amounted to \$22,753,289, while operating expenses totalled \$13,644,524. Net earnings as reported in the difference between gross receipts and operating expenses were \$9,108,765, in 1918, as compared with \$8,025,855, in 1917. Additions to and subtractions from primary net earnings reduce that amount to \$5,187,323.

Telegraph Business

Coming to the telegraph companies, the figures presented show that on June 30th, 1918, their cost was placed at \$10,226,988, a slight increase over the previous year, while the capitalization of the companies having headquarters in Canada was \$6,300,000. The gross revenue was \$7,770,646, as compared with \$7,272,755 for the previous twelve months. Operating expenses were \$5,820,335, as compared with \$4,940,228 during the previous year. The net operating revenue amounted to \$2,016,429. Wire mileage totalled 210,100, a slight increase over the previous year. The number of telegraph offices totalled 4,664, as against 4,615, at the end of June 1917.

Toronto Section A.I.E.E. Elects Officers

The annual meeting of the Toronto Section of the American Institute of Electrical Engineers was held at the Engineer's Club rooms on Friday evening, April 25. Mr. W. B. Buchanan, of the Ontario Hydro Laboratories, delivered an address on the subject, "Some Overload Limitations of Current Transformers."

The following officers were elected for the ensuing year:

Chairman, Ashton B. Cooper, Canadian General Electric Company.

Secretary, Daniel M. Fraser, Canadian General Electric Company.

Executive, L. B. Chubbuck*, Canadian Westinghouse Company; A. C. Johnston, Canadian Westinghouse Company; H. C. Don Carlos, Ontario Hydro-electric Power Commission; F. R. Ewart, Ewart & Jacob; C. Sisson*, Canadian General Electric Company; W. Volkman, Toronto Power Company.

*Out of town members.

The next meeting of the Section will be held on Friday, May 2nd, when a lecture will be delivered by Professor Vladimir Karapetoff, of Cornell University, on the subject "The Fundamentals of the Magnetic Circuit."

Electrification of Steel Mills

G. E. Stoltz, of the Westinghouse Electric and Manufacturing Co. of Pittsburg, addressed a joint meeting of the Hamilton branch of the Engineering Institute of Canada, and the Toronto section of the American Institute of Electrical Engineers, on April 11th, in Hamilton. The subject of the address was the electrification of steel mills, and the speaker described, with the help of many lantern slides, the advantages of electric motors over steam engines in every application of power in the manufacture of steel. The address was followed by an interesting discussion by the engineers present. The meeting, the attendance of which was over 150, was held in the auditorium of the new office building of the Canadian Westinghouse Co., Hamilton. On the following day, the visitors from Toronto, accompanied by a number of local engineers, visited the plants of the Dominion Foundries and Steel, Ltd., the Dominion Power and Transmission Company, and the Steel Co. of Canada.

Montreal Electric Club

In a paper on "Defective Lamps," read at the Montreal Electrical luncheon, on April 16, Mr. P. Klein, Jr., described in detail the causes of defective lamps, such as failures of bulbs, mechanical supports, filament supports, burn outs, broken filaments, etc. The evaporation of tungsten from the filament was one of the principal causes of the ultimate failure of the lamp, the amount evaporated being regulated by the temperature. A lamp was rated to burn 1,000 hours, and it paid to discard lamps which had burned that time. While it was not always possible to tell the causes of failure, there were, as a rule, indications which were good guides. A rise of 10 per cent. in voltage reduced the life of a lamp by 60 to 70 per cent., and it was, therefore, important for large users of lamps to ascertain the proper voltage of the lamps they purchased.

Toronto Club Hears About Chippewa Plant

Mr. Harry G. Acres described the plan and the development work to date, on the big Chippewa Power scheme, before a record attendance at the April 25th meeting of the Electric Club of Toronto. Mr. Acres first referred briefly to alternative schemes and explained in general outline the advantages of the plan finally adopted, which is approximately a four-mile dredge up the Chippewa River, and an eight-mile cut through earth and rock. Some particularly good lantern slides assisted Mr. Acres to give the members a good general idea of the whole scheme of operations, which is simply colossal in magnitude. The whole of the equipment, as a speaker observed, is "special" and the fact that such splendid progress has been made, under conditions for which there was no precedent to follow, reflects the greatest credit on the whole Hydro staff.

The chairman, Mr. K. J. Dunstan, in thanking the speaker, made reference to the pride the members all felt in the fact that this record development scheme was being carried on in our own Dominion and under the entire guidance of Canadian engineers. Mr. Dunstan also took occasion to express the thanks of the members of the club to Mr. P. A. Borden for his unselfish and most efficient assistance during the year, without which the splendid illustrated lectures delivered before the Club would have been impossible. The members, by their applause, clearly indicated their acquiescence in the president's remarks.

The meeting of Friday, May 2, will be addressed by Mr. Paul Balbaud, recently returned from France and Germany.

The annual and final meeting of the year for the presentation of reports and election of officers, comes on May 9.

Developments in Wireless Telephony

At their weekly luncheon on Friday, February 7th, the members of the Electric Club of Toronto were highly honored in the presence of a distinguished guest, Dr. F. B. Jewett, chief engineer of the Western Electric Company, New York, and Director of Research of the American Telephone and Telegraph Company, who told them, in the clearest and most concise way possible, of the development of wireless telephony, which in an almost incredibly short space of time has grown from a "crazy idea" to an accomplished fact. Dr. Jewett, as pointed out by the chairman, had not intended to come to Toronto until Saturday, when he was to address the Royal Canadian Institute on "Industrial Research," but made his visit a day earlier in order to address the Electric Club.

Dr. Jewett began his address by giving a short history of the wireless telephone. Apparatus for this had probably been considered from almost the start of wireless communication of any kind, he said, for if you could provide the facilities for one human being to talk to another and eliminate intermediary operators, you greatly increased its utility. In the early days it seemed almost impossible to do anything with radio telephony, because the spark system only was known, by which system with a sudden impulse you produce a train of waves with big spaces between them. This did not lend itself to speech because the continuous nature of telephone communication entailed continuous wave train type of transmission. Some years after this latter system was pretty well developed, experiments in telephony had been tried out in England, Italy and the United States, but with little success, because at that time it was impossible to control by means of the voice the enormous amount of energy required on the antennae. Some years ago, back in 1913 and 1914, the American Telephone and Telegraph Company, in connection with the development of their transcontinental line, were looking for and found an amplifying apparatus now commonly called the vacuum tube. Some research work done in experimenting with this device indicated the possibility of making use of a modified form of the apparatus for radio telephony. It seemed that it not only possessed the requisite properties for generating the continuous wave of radio frequency and of putting the voice frequency on this, but also could amplify it up to sufficient horsepower for long distance transmission. The result was that in the latter part of 1914, his company set up a radio station on Long Island and in the early part of 1915 they actually telephoned from there to the Dupont Building at Wilmington, Del. They also introduced wire lines in the circuit, talking from New York to Long Island over the telephone lines, where connection was made with the radio and the conversation transmitted to Wilmington by wireless and then again transferred to the wires and transmitted back to New York. A radio station was also put up at Brunswick, Ga., and conversation carried on in a similar circuit, partly over lines and partly by radio.

Talked With Paris in 1915

The experimenters were then convinced that it was possible to transmit conversations by radio over very great distances and in the latter part of 1915 they talked from Arlington Naval Station in Washington to Panama, to San Francisco, to Honolulu, and later to the Eiffel Tower in Paris. In all of these conversations wire lines formed part of the circuit at the terminal station.

All this work was done partly for scientific reasons and partly for the purpose of ascertaining the commercial feasi-

bility of wireless telephony. It was, however, to prove of very considerable value in war work. Immediately after these experiments the United States navy saw the possibility of using the radio telephone for certain short range service and from then on energies were devoted to the short-range type of set—from ten to fifteen up to two hundred miles. This, it was seen, could be used to advantage in a naval squadron, enabling the commander to talk to the accompanying vessels without the use of signals.

Dr. Jewett told how General Squier called him to Washington in 1917 at the beginning of the war to have a conference with the British liaison officer on aeroplane service. It was pointed out that the wireless telephone was of particular interest at that time, the problem being to communicate between the various planes of a squadron and between the ground and the aeroplane. The work done up to that time was sufficient for Dr. Jewett to give assurance that this was a reasonable possibility, and in July of the same year they actually had a squadron of aeroplanes in the air with crude wireless equipment and in November, with finished forms of equipment. This same sort of development was at the same time going on very actively in England and also to some extent in France, but he thought the greatest progress had probably been made on this continent.

The principal problem was the actual use of the telephone on the aeroplane on account of the noise of the engine and the wind. What was practically the greatest difficulty was the design of a transmitter and receiver and a form of mounting and helmet which would enable a man to talk to another man in the same aeroplane. Finally a device was produced by which a man could talk in an ordinary tone of voice with his mate in the same plane, and could also talk with a man in another plane or on the ground by simply throwing a switch. In training, it was possible for the instructor on the ground to advise the men up above what they should do.

Instant Control of Battleships

The navy then came along and said that the tactics of submarine chasing were such that the wireless telephone was just the thing required in the squadrons used for that purpose. As a result, after a certain date, all the submarine chasers that left the United States were equipped with radio telephones with a range of ten or fifteen miles. The equipment was placed on the bridge, so that the commander could talk to any other boat in the line. Neither was it necessary for those receiving the message to hold receivers to their ears as the receiving apparatus shouted out the words in a loud voice. The speaker himself had accompanied a squadron of chasers to see how the system worked out, and it was really wonderful to note the quick response to a command. When the captain decided to stop, he gave the order in an ordinary tone of voice and in anywhere from 30 to 40 seconds every boat, some of them miles away, had been stopped. The result was that a squadron of chasers was put in the same position as an officer and a squad of men.

Dr. Jewett said that the radio telephone had probably played a greater part on the boats than on the aeroplanes. He did not think any great quantity of equipment got over to France in time to be of much use on the latter.

Aside from the designing of the apparatus the principal difficulty was in the manufacture of vacuum tubes—a very important and very complicated part of the device. From November or December, 1917, when it was finally decided that the wireless telephone was good military material, the production of these vacuum tubes, which had previously been purely a laboratory product, rose from two or three hundred a week up to 30,000 a week at the time of the signing of the armistice, the manufacture of the apparatus having been entirely commercialized in that period. The need in such great quantity was due to the fragility of the tubes and

also the fact that they are short-lived, particularly if handled carelessly by the operators.

Dr. Jewett then proceeded to explain the fundamental principle of the radio telephone. The human voice makes use of a certain range of frequencies, which has been found by experiment to be from 200 per second to 2,500 per second. Actually there are some overtones which run up above that, but for practical purposes this is the range the telephone is designed for. The radio frequencies are up in the hundreds of thousands or the millions. For the short-range type of apparatus, the frequencies are measured by the millions. The problem then was in some way or other to impress on the high frequency carriers the voice frequencies and when they got to the distant end to catch them on antennae, sift out the high from the low and bring the latter to a reasonable amount so that they could be heard. The whole thing is done by the vacuum tube. In one tube at one end there is electrical resonance at high frequency, which with a low voice frequency is fed into another tube where the two are mixed together. In this second tube the impressed voice frequency tends to chop off tops of the high frequency. The whole is then passed through an amplifier and passes out on the antennae at about 10 h.p. At the distant end it is run through a demodulating or detecting circuit which takes out the high frequencies and the low frequencies are carried into a telephone receiver.

One other problem in connection with the use of the radio telephone on the aeroplane was the question of the source of supply of the electrical energy for the radio apparatus. There were three methods of getting the power. One was to hook up a dynamo to the main power plant of the aeroplane; another was to carry along a storage battery, as large as possible, and with a life as long as might be needed; and the third was to use a little wind-driven generator, fastened to the aeroplane and furnished with a propeller. The first plan was abandoned because the aviator did not care to have any attachments to his engine and furthermore, the engine would not always run at the same speed and might be cut off altogether just at the moment when it was necessary to telephone. The storage battery was not favorably looked upon because of its weight and relatively short life, and also on account of the shortage of shipping for conveying them to the points where they might be needed. So they were forced to the wind-driven generator. The requirements put up were these—that the telephone should transmit satisfactorily and at maximum range whether the machine was climbing at the steepest angle, or nose-diving with engine on. It was actually found that the wind-driven generator had to operate with a speed varying from 400 to 14,000 revolutions of the propeller per minute. The solution of this problem again was a vacuum tube. The generator armature had two windings, one to give about 30 volts for the filaments of the radio set and the other to give about 300 volts for the plate circuits. There were two shunt field windings—the main one was in series with the filament of the regulating vacuum tube and the field current was sufficient to heat the filament and cause it to give off electrons, the other was differentially wound with respect to the first and was in series with plate and filament. If the machine increased speed, more current tended to flow through the field and heated the filament up. The hotter it got, the more electrons were given off, providing more current for the differential circuit. Finally they got a machine that would keep the voltage constant within about 10 per cent. over this range of speed variation.

In our issue of April 15th it was stated that an effort was being made by the Ottawa city council to acquire the light and gas plants of the Ottawa Electric Company. We are advised on competent authority that this is not the case.

Growth of Profit Sharing Idea

In a discussion of the advantages and disadvantages of various profit-sharing schemes, outlined in a recent issue of their Sales Service Magazine by the Society for Electrical Development, a list of electrical companies in the United States coming under this category is given. It is an interesting variety, as follows:

A Brief Mention of Plans in Actual Operation

A Western jobber has for several years operated a profit sharing plan, the terms of which can be so simply stated that every stockholder and employe understands them perfectly. From the year's earnings there is first set aside 8 per cent. on the capital investment, to be paid to the stockholders. In addition, two per cent. is set aside as a reserve fund. All profits remaining above the foregoing 10 per cent. are then divided "50-50" between stockholders and employes. The half going to the stockholders is divided in the proportion of their holdings. The half going to the employes is divided first into two equal parts. The first part is distributed among employes on the basis of each individual's annual salary in proportion to the total salary roll of all employes (not including the officers of the company, who take no part in the profit sharing except as stockholders). The second part of the employe's share is divided among them in proportion to the time of service of each to the total time of all employes participating. Only employes who have served the company one year or more participate in the profit sharing plan.

The California Edison Company has in operation a profit sharing plan whereby approximately 900 of its officers and employes are availing themselves of the following plan for securing shares of the common stock of the company. Each officer or employe is permitted to subscribe for shares of the par value equal to not more than ten times his monthly salary. That is to say, an employe receiving \$200 per month could subscribe for twenty shares of the par value of \$100 or \$2,000 of the stock. These subscriptions are paid for by deductions from monthly pay checks of a sum equal to 7½ per cent. of the past month's salary, and credited to the purchase price of the stock. Subscribers are also credited with all dividends which accrue on their stock from the date of the original subscription. Profit sharers have the privilege of paying as much more than 7½ per cent. of their salaries monthly as they desire. For those receiving one hundred dollars or less per month an alternate plan has been provided permitting them to pay for their shares at the rate of \$1.00 per share per month.

The Consolidated Gas Company and the New York Edison Co., and their affiliated gas and electric companies, including those in Yonkers, Westchester, Northern Westchester, Queens and the Bronx have adopted a profit sharing plan.

The General Electric Company of Schenectady, N.Y., announced some time ago that with the exception of directors and executive officers, all employes who have been in the service of the company for five years or more will receive in two installments, a bonus equal to 5 per cent. of their annual wages.

Mr. R. W. Rollins, of the Worcester (Mass.) Electric Light Company, speaking at a recent convention of electrical interests at Boston, said that during the five years prior to 1916, employes had received 2.5 per cent. bonus on their salaries, while last year they received 5 per cent.

Mr. Riddell, of the Greenfield and Turners Falls Companies spoke of the excellent results accruing from the holding by employes of an issue of stock, specially designed

for them. Since the movement started, a marked improvement in their interest in the work of the company has been noted. The stock is sold at par and draws 6 per cent.

The City Light and Traction Company, Sedalia, Mo., is offering a bonus to the employes of the Broadway electric plant for reducing the coal consumption less than 6½ lbs. of coal per kilowatt-hour, the employes receiving 25 per cent. of the cost of the coal saved on that basis.

The Manila (P. I.) Electric Railway and Light Co. inaugurated a bonus plan in 1915, whereby employes of the power plant receive a bonus upon all savings in the use of

coal effected in accordance with the stipulations. Reports are that the plan is working successfully.

The Alabama Power Company, of Birmingham, Ala., at Christmas time gave a bonus of 2½ per cent of the year's salary or wages of all the employes who had been with the company one year or more.

The United States Steel Company, Westinghouse Co., Henry L. Doherty Co., Union Electric Light and Power Co., Mahoning & Shenango Ry. & Lt. Co., Ridgeway Electric Light Co., and many others too numerous to mention use one or another of the plans that have been outlined.

New Emergency Bus Feature in Brantford Hydro-Electric Station

Realizing that some method of oil-switch examination and protection was necessary in the various hydro stations, Mr. W. R. Catton, manager of the Brantford Hydro-electric System, has designed and installed a switching system of which photographs and drawings are herewith shown. The schematic drawing of the connections is shown in Figure 1, the lower left hand bus being the regular operating bus, the transformer bus to the right hand side being connected to series and voltage transformers to either bus as desired by means of disconnecting an oil switch. In this way, using the connection, as shown in Fig. 1, the totalizing of the load is taken care of no matter which way the current may be fed. The auxiliary bus is the top bus shown on Fig. 1.

The scheme contemplates the use of double-throw single-pole disconnecting switches, which are mounted on top of the board with barriers between, three disconnecting switches being used to each circuit. The circuits being properly marked with red, white and blue bands about one inch wide on the switch blade itself. The main bus is painted red, white and blue giving the same designation and circuits. It is to be noted that the double throw disconnecting switches are so arranged that the blades can be thrown separately, this being so that the circuit can be connected up without interrupting. Careful phasing-out having been done, this paralleling of the auxiliary bus and the main bus can be done with safety. The scheme, as a whole, acts in a similar way to a loop line off boiler pipes, between the boiler and engine, with suitable valves, which compare with the oil switches and disconnecting switches on the electric system.

The ordinary procedure of changing over any one or all of the circuits to the auxiliary bus is to throw the disconnecting switches up on the upper set of bus bars, closing the oil switch which feeds the auxiliary bus with a proper setting to take care of the load to be taken care of, (description of which will be given later), pulling out the lower set of disconnects and the middle set of disconnects on the double throw disconnecting switches. This clears the oil switch on this particular panel entirely and any work can be done upon this panel as desired, in the way of work on the instruments, oil switch or series or voltage transformers, the load being entirely fed through the auxiliary bus for the time being. Circuits are opened and closed with oil switches only.

Previous to the installation of this equipment, the oil switches or their parts could not be repaired without an interruption, and the oil switch, necessarily, had been neglected and the oil probably had not been renewed as often as would be, if it were convenient to get at the oil switch. Mr. Catton points out the advantages he has already found in his switching system, which has only been operation some two

to three weeks, namely. First: To kill any phase on lighting feeders, which is a 4,000 volt Y system; second: to kill any oil switch and make repairs on switchboard; third: the paralleling of the feeder with the emergency bus before killing the equipment, thus preventing any interruption or stoppage of motors on the particular feeder which is to be thrown over onto the auxiliary bus; fourth: on Sunday when the load is down to a minimum, complete feeders can be operated on the emergency bus and the entire switching equipment killed with an opportunity to overhaul bus or repair any parts that are required on the switchboard, the operator being able to work with perfect safety on any part of the board. This is shown in photo, Fig 3, below top row of disconnecting switches.

The transformer oil switches are not at present protected by such a system, but could be easily protected, and probably will be later, and equipped with a similar system so that the oil switches can be repaired on the transformer bank if necessary. These switches, however, do not operate as much

Fig. 1.—Wiring Connection Diagram

and would not therefore require as much care and attention in the way of repairs.

The question of the setting of the auxiliary panel for operating the emergency bus is worked out with the simple collective revolving switch, which is connected with the series transformer in such a way that the settings are approximately 20 amperes to 120 amperes up to 200 amperes by steps of approximately 20 amperes per step as arranged for. Any feeder can be put on the busbars and amply protected by set-

ting equivalent to the load to be carried. This is arranged so that the trip on the oil switch which operates this panel is connected with the series transformers to the collective revolving switch.

The auxiliary panel for operating the emergency bus is arranged with a high and low reading ammeter to get close readings throughout the scale and as stated above, the trip coil and relays are all arranged to be operated with the collector revolving switch, which connects the secondaries of the two transformers of various taps brought out in a position which gives various settings for various types of load.

The operation of transferring the feeder to the emergency bus will be the closing of the top disconnecting switches to each phase of the particular feeder selected to be closed, the setting of the auxiliary bus bar switch to the proper value of the circuit or circuits to be connected, the closing of the emergency or auxiliary bus oil switch and the disconnecting of the lower double throw disconnects and the single pole disconnects below it, the three phases of each, of course, being disconnected.

In transferring the whole station the setting on the auxiliary bus rotating switch will be kept to the highest value. This means you have the protection on any load up to the capacity of the oil switch, which is 200 amperes and 4,000 volts star connection, grounded neutral.

The layout of the above equipment was designed by Mr. Catton and the equipment was furnished by the Canadian Westinghouse Company. It will be readily seen from the photographs shown herewith that this outfit makes a neat and safe arrangement, as all the disconnecting switches are out of reach, being at least 7 ft. 6 in. to the bottom of the first floor of disconnecting switches. The same equip-

ment in a modified form has been put in at the Windsor Hydro-electric station by Mr. O. M. Perry, manager of that plant and the Walkerville system of which Mr. McHenry is manager contemplates its use. It is predicted that many of the other stations will avail themselves of Mr. Catton's ingenious scheme to take care of their local conditions.

Lower Rates in Canada

Apropos of the low rates charged in various parts of Canada for domestic purposes and more particularly throughout the Hydro area of the province of Ontario, it is interesting to compare figures in the United States, recapitulated in a recent article in the Monthly Sales Service of the Society for Electrical Development. This article shows that there are 4,573 towns or cities in the United States where a rate of five cents or less is charged for electric heating and cooking. Of this total, however, only four give a rate as low as 1 cent; three give 1½ cents; forty-five give 2 cents, and the remaining 4,521 are higher than 2 cents. The most general rate is 3 cents, which prevails in 780 towns.

The employees of the Bell Telephone Co. in Montreal have formed a society under the name of the Telephone Association of Montreal, of which Mr. McMahon is president. It has three main objects, dealing with education, the social side, and sports. The programme includes lectures and smoking concerts. The membership is free. A recent concert was attended by the president and all the principal officials, in addition to many employees from outside points. During the evening the MacFarlane Cup, the trophy of the Bowling League, was presented to the contract team.

The Tungar Rectifier—Its Theory, Characteristics and Applications

By Mr. F. Keith D'Alton

Unidirectional currents are obtainable from alternating currents by three well known methods, namely, regeneration, conversion and rectification.

The first of these methods makes use of a motor-generator set whereby the energy supplied by alternating current to the motor is first entirely turned into mechanical energy and then again transformed into electrical energy and delivered as direct current from a commutating generator.

Under the heading of "Conversion" we consider the action of the rotary converter where electrical energy is in part (a very small part) turned into mechanical energy to keep the armature revolving, but principally the energy is turned from alternating current to direct current by the magnetic relations in the machine and the commutator on the d. c. end.

"Rectification" differs from both of the above in that no part of the energy supplied is transformed into mechanical energy. The rectifier controls the alternating current in such a manner that the current permitted to flow through the rectifier is in one direction only. This is accomplished by either the complete stoppage, or the reversal in direction, of such part of the alternating current as would flow in the opposite direction to that desired.

By "unidirectional currents" we naturally refer to currents flowing in the one direction. The several methods, by which alternating currents give these non-reversing currents, differ, not only in method, but in result as well, and in application.

The rectified current, as will be seen later, may be used for the majority of the purposes to which generated direct current may be applied. The rectified current is usually pulsating; there are a few cases, therefore, where it does not give satisfactory results, one example being the calibration of electrical instruments.

In the following paragraphs, a comparatively new type of rectifier will be described, i.e., the Tungar rectifier. This novel little device will be considered in regard to the theory upon which it is built, the various connections in which several may be linked together with the advantages of each arrangement, and the many purposes to which the single rectifier, and also groups of rectifiers, may be applied.

In addition, the electrical characteristics are illustrated by graphs and the behaviour of the rectifier is clearly shown by the numerous oscillograms which form part of this description.

The Principle of the Tungar Bulb

For many years, scientists were satisfied with the well known "molecular theory" as basis for explanation of all that was happening in the material world. Recent research work, however, has found many strange phenomena which this molecular theory was not able to explain. The electron theory, based on the molecular theory, goes deeper than the latter, and states that all atoms contain charged particles, some positively charged, some negatively charged, and that a current of electricity is merely a movement of these particles along a conductor or through an electrolyte.

The negatively charged particle is termed the "Electron." Some very strange phenomena, observed in laboratory experiments, are easily explainable by this "Electron Theory," and it is upon this theory that the Tungar rectifier is constructed.

When a metal is heated to incandescence in a fairly good vacuum, there is an emission from the metal of minute material particles each carrying a negative charge of electricity, i.e. electrons.

As the law of attraction and repulsion between charged particles is that unlike charges attract while like charges repel, it may readily be expected that any positively charged body in the neighborhood will attract to itself these negatively charged particles. The result then is that we have a passage of electrons from one body through space to the other body. These electrons are charge-carriers; a flow of electrons is therefore, a flow of charges, i.e., a current of electricity. Hereinafter, unless stated to be otherwise, the word "current" refers to this current above described.

Consider now, the Tungar bulb, part of the Tungar rectifier, as illustrated in Fig 1. The hot metal is a tungsten filament, designed and arranged to be heated by the passage through it of an electric current from some source, (either d. c. or a. c.) the purpose of this current being for heating only. Above the filament and close to it, is placed another body, not heated; this, in these bulbs, is a graphite button.

The filament is now heated and emits electrons; the graphite button is charged positively with regard to the filament. Hence a flow of electrons, (negative charge carriers)

Fig. 1—The Tungar Bulb

takes place from the filament to the graphite and around through the circuit outside connecting these electrodes.

Electrical engineers have a certain system of signs for the direction of flow of current and, according to these, a current flowing in a given direction is said to be a "positive" current. The opposite direction of flow is called "negative."

Now, in the tube we have a negative current flowing from filament to graphite block. According to our conventional terms we state the condition as being positive current flowing from graphite block to filament inside the bulb.

Therefore, we consider the current to flow in at the top

of the bulb, (negative pole) to the graphite (anode) and across the gap to the filament, (cathode) then out by the base, (positive pole) and around the circuit, and in again at the negative pole.

The graphite is comparatively cold; it does not emit any electrons, even if the polarity of the charges be reversed, and therefore there can be no reverse flow of current.

Increasing the relative difference in charge between the anode and cathode will permit a greater flow of electrons and

Fig. 2 (above)—The Sine Wave—Alternating Voltage

Fig. 3.—Rectified Current Wave.—No load.
"One Half Wave Rectification"

Fig. 4 (Below)—Potential Drop across the Bulb—Full Load Half Wave Current Flowing

therefore a rectified current of greater magnitude. This relative difference of charge is controlled by varying the outside source of voltage that is used to propel current around the circuit.

The temperature of the filament sets an ultimate limit for the value of this current from anode to cathode.

For a fixed temperature of the filament, the flow of current will vary with the applied voltage, but with a fixed applied voltage the flow will vary with the temperature, up to a certain point only after which increase in temperature does not cause increase in current flow.

The above statements apply in a circuit where the resistance, external to the bulb, is negligible, for otherwise Ohm's law applies and the current is also inversely proportional to the resistance.

It will be observed in Fig. 1 that the tube is not a vacuum but is filled with argon gas. These electron emissions will occur in a vacuum, as is shown in the working principle of the kenotron, but in the Tungar rectifier the working voltage is low and it has been found that the current flow is much increased by the presence of argon when the filament is of tungsten.

The argon gas used is purified by a specially prepared agent, the composition of which is still a secret with the manufacturer. This purifying agent is introduced into the bulb at the time of manufacture and evaporates when the bulb is first put into service. In evaporating it deposits itself on the inner surface of the bulb causing a dark discoloration. It is only in the matter of appearance that this discoloration is objectionable.

Presence of air very materially impedes the current flow,

and a very minute quantity of air, or pure oxygen, causes the tube to emit a delicate purple light when under load.

Now we have spoken, at length, of the theory of the Tungar bulb. There is one more point to bring to the reader's attention, namely, that an alternating voltage applied between the graphite button and filament, can produce only a uni-directional current in the circuit, as current passes only when the filament is cathode and the graphite block anode, and not vice versa.

As we have stated already, the current is proportional to the voltage applied when the temperature of the filament is constant. Consequently, when rectifying a sine wave, we are not surprised to find that the rectified waves of voltage and current have about the same shape as the half sine wave.

Characteristics of the Bulb

In Fig. 2 we have a pure sine wave of alternating voltage which we apply between cathode and anode and we have then a current flowing as shown in Fig. 3. Half of the wave is completely blocked, the active half being reproduced fairly accurately in the current.

Now Fig. 4 is the potential drop across the bulb when voltage of Fig. 2 is applied and the current of Fig. 3 flowing. Naturally during the half cycle that no current flows, the potential drop across the bulb itself will be the same as the voltage applied, but during the half cycle in which current flows, the drop will be that due to the current flowing through

Fig. 5—Characteristics of Bulb, Watts loss and filament current, varying load.

the resistance of the bulb. It is seen to be only a small part of the applied voltage and is lettered "IR Drop."

Judging by the oscillograms we might be inclined to think that the drop varied as the current (roughly) and that the resistance of the bulb was constant, but we find that the watts loss in the bulb, varies as the load current, Fig 5 signifying a gradually reducing resistance as the load increases.

The filament current decreases here as the load increases this being due to the connections used but not seriously affecting the watts loss curve.

In Fig. 6 we see another characteristic of the bulb, namely, with constant loads the loss in the tube reduces as the filament current, and consequently the temperature, is increased. This effect is much more marked at the low loads.

(It will be observed that load currents are being measur-

ed by d. c. instruments. The a. c. and d. c. instruments read different averages of the current or voltage waves, hence one or other must be used and definite'y stated, as is explained more fully later.)

One very strange effect noticed when the load is in excess of one ampere (on the 6 ampere bulb) is that the filament heating current is necessary for starting only and may be turned off after the tube is started without affecting the load current in magnitude or wave form.

Under normal conditions, with filament current flowing, the filament is uniformly bright throughout its length but when the filament current is turned off, the electron emission is localized at one end of the filament. This, without doubt, will cause the filament to wear away more rapidly.

The Tungar Rectifier as Placed on the Market

To the General Electric Co. of Schenectady, N. Y., belongs the credit for the development of the Tungar rectifier. It is the result of research in their laboratories.

A very practical rectifier has been designed and is sold complete, and ready for attachment to a lamp socket, primarily for the purpose of charging storage batteries.

The rectifier consists of a small transformer, a rectifying bulb, and socket for its support, and the necessary fuses to protect the circuits.

These transformers are designed for different voltages and for different frequencies, but principally for 115 volts, and 25 and 60 cycles.

The bulb itself is made of glass, about 3 inches in diameter and is designed to fit a mogul socket thus facilitating an interchange of bulbs. The mogul base is used in place of the Edison standard base since the current to be handled is chiefly the filament current which is more than can be safely carried through a standard Edison socket.

As all bulbs are tested before being shipped, the purifying

Fig. 6.—Characteristics of Bulb. Losses, with constant load currents, but varying filament current

agent has already done its work when the bulb is sold. Hence a new bulb has much the same appearance, as a worn out tungsten or carbon lamp, but this discoloration does not affect the operation of the tube unless the deposit be excessively thick, in which case the bulb will overheat and may have a short life.

The life of a bulb varies from six hundred to three thousand hours. Some bulbs, however, have been known to give over eighteen months of nearly continuous service. The

failure always occurs in the filaments, and in order to give the bulb a long life the filament is made particularly rugged. Furthermore, there are several designs for different current capacities as follows:

1. The 2-ampere unit, which when operating on 115 volts a.c. (single phase) will charge three cells at 2 amperes; six cells at about 1 ampere, and eight cells at about 0.75 ampere.

2. The 6-ampere, 7.5/15 volt unit is for charging either three or six cells of lead battery at 6 amperes when operated on 115 volts a.c. (single phase).

3. The 6-ampere, 7.5/75 volt unit is for charging from three to thirty cells of lead plate battery at from one to six amperes.

As it is evident that No. 2 size of rectifier will be the size

Fig. 7 (above)—The Tungar rectifier in metal box.

Fig. 8 (Below)—The Disassembled Rectifier.

of most interest to automobile owners and, in fact, to the majority of people using storage batteries where they desire to charge the cells themselves, we will hereinafter confine our statements to this size, as designed for 115 volts, 25 cycle, realizing at the same time that what is said regarding a 25 cycle rectifier applies equally well to a 60 cycle rectifier since frequency does not in any way influence the characteristics of the rectifying bulbs themselves and need only be taken into account in the auto-transformers supplied as part of the rectifier.

Fig. 7 shows the rectifier (No. 2 size, 25 cycle) as supplied by the General Electric Co. Fig. 8 shows the disassembled parts of the same rectifier, giving their relative size. Fig. 9 is the small auto-transformer alone, while Fig. 10 shows two bulbs of the same size. The dark discoloration already referred to may be observed in the dark bulbs in this photograph.

Form Factor

A few words in regard to "Form Factor" is stated here, may pave the way for a clearer understanding of and greater appreciation of the value of the different connections to be described.

An alternating current instrument (moving vane type) and a direct current instrument (permanent magnet type)

will give the same indication on a smooth uniform direct current, but if the current be pulsating the indication of the a.c. instrument will be higher than that of the d.c. instrument.

The a.c. instrument reads the root-mean-square value of the wave whereas the direct current instrument reads the simple average. The ratio of a.c. instrument reading to the d.c. instrument reading is called the "Form Factor" of the wave.

$$\text{Form Factor} = \frac{\text{A.C. instrument reading}}{\text{D.C. instrument reading}} = \frac{\text{root-mean-square}}{\text{average}}$$

Obviously, the form factor of a direct current is 1.00. Form factor can never be less than unity, and consequently the

Fig. 9 (above)—The Auto Transformer.
Fig. 10 (Below)—Two 6 amp. 7.5/15 volt Tungar bulbs, showing discoloration due to purifying agent

lower the form factor (the nearer it is to unity) the nearest is the approach to a smooth direct current.

The form factor of a half sine wave, i.e. a half wave of sine form with only one half wave per cycle is 1.575.

If currents be considered, then the r.m.s. value is the heating value, whereas the average value is the effective value in charging or discharging a cell. Since it was chiefly for this work of charging cells that the Tungar rectifier was originally designed, we think it best to use d.c. instruments for measuring the rectified currents, thereby reading directly the charging value of the current.

(Continued in May 15 issue)

The Hamilton retail merchants are holding a "Retailers' Week" in that city during the week April 29-May 2. The evening of May 2 has been designated Ladies' Night and, being the special event of the week, the Hamilton District Electrical Association have been asked to provide the entertainment.

The Winnipeg Light and Power Department have arranged to purchase property on Scotland Avenue for the erection of a sub-station.

British Aluminium in New Quarters

Owing to the greatly increasing business of the British Aluminium Company and to their policy of carrying a stock of nearly 100 tons aluminium for the benefit of their Canadian customers, they have removed to larger and more convenient office and warehouse premises. The new Canadian headquarters of the company is now at the Purman Building, 265 Adelaide Street, West, Toronto. The office, warehouse and stock rooms are very large and well appointed, having a frontage of nearly 100 feet on Adelaide street, and anyone interested in aluminium will find it time well spent to pay a visit to these premises where a permanent exhibition of the different applications of the metal is always on view. In addition to this extension the company is endeavoring to take care of its increasing business by augmenting its staff in the Toronto office and a well known expert in aluminium, Mr. E. T. Driver, B. Sc., will shortly take up the position of technical adviser.

The war has been the greatest advertisement, perhaps, that aluminium ever had. To meet the many varying conditions of service new and intensive means of production have been devised and in one particular direction, viz. the production of new alloys, the knowledge gained in the last four years has been more than was ever known about aluminium alloys before.

Business in general is rapidly adjusting itself to the conditions of peace and aluminium is every day in stronger demand for the manufacture of kitchen utensils and specialties, the construction of automobile bodies and parts, and for wire and cable and other uses in the electrical field.

Personals

Mr. Wm. C. Brown, of the New Brunswick Power Company, St. John, N. B., has resigned to go with the Canadian General Electric Company.

Mr. H. M. Miller has been appointed Hydro engineer at Carleton Place, Ont., extension. Mr. Miller was formerly superintendent at St. Marys, Ont.

Mr. W. G. Murrin, assistant general manager B.C.E.R. Company, has just returned from a nine weeks' vacation in California where he went for the benefit of his health.

Mr. J. A. Anderson, who was for 32 years with the Bell Telephone Co., Montreal, and was formerly superintendent of traffic, has resigned. He has started in business at 85 Cathcart St., Montreal, as electrical contractor and supplies.

Obituary

John Lennox, a well known Hamilton, Ont., business man, was accidentally drowned on Wednesday, April 24th. He had often spoken of the fact that he was Hamilton's first street car conductor.

D. B. Detwiler, a native of Waterloo county and a prominent Kitchener manufacturer, died on April 18, after an illness of about six months. He was president of the Algoma Power Company and was a prominent member of Kitchener Electric Light Commission, having been a strong supporter of Hydro since its earliest days.

Reflectors—The Harvey Hubbell Company of Canada have issued a folder illustrating a number of types "merely to convey an idea of the variety of the Hubbell line." The regular catalogue of this company, No. 16, lists and illustrates over 200 different shapes and sizes.

The 1919 Convention of the Illuminating Engineering Society will be held in Chicago, Illinois, early in October. Details will be announced as soon as definite plans are formulated.

The Contractor-Dealer

Standard Accounting System for Contractors and Dealers

Realizing that the business of the electrical contractor-dealer, with regard to the merchandising of material, required improved cost and accounting methods, The National Association of Electrical Contractors and Dealers, in 1917, appointed a committee to consider this subject. The various associations and societies in the electrical industry were called in to co-operate in devising a system of accounting to cover the present and future needs of the electrical contractor and dealer.

This system has now been approved and endorsed by the National Electrical Credit Association, the Accounting Committee of the Electrical Supply Jobbers' Assn., the Accounting Committee of the Associated Manufacturers of Electrical Supplies and the Society for Electrical Development and has been formally ratified and adopted by the Executive Committee of the National Association of Electrical Contractors and Dealers.

This system conforms generally with the accounting systems of the various electrical manufacturers' associations and the Electrical Supply Jobbers' Association, so that accounting information furnished by the various branches of the industry will be uniform and comparative, and enable the electrical industry to furnish satisfactory and comparative information to any governmental body.

The National Association urges the entire trade to adopt the system described on the following pages, which it is prepared to supply at a cost that is a definite saving to the users.

Cardinal Principles

1. All forms should be standardized.
2. All sales, whether contract, jobbing, day work, or retail, should be costed.
3. A merchandising account should be created through debit entries for purchases and credit entries at cost for materials sold in any way.
4. A general ledger containing all controlling accounts should be made a part of this system.
5. All liabilities should be vouchered each month irrespective of receipt of goods or correctness of invoice. Provision should be made

for charging vendors for any errors or discrepancies in bills.

6. Cash book should combine bank records, both receipts and payments, that, debit entries equalizing bank deposits for the month and credit entries equalizing charges to bank balance. The cash book should not be used for distribution.

Every contractor and dealer intending to follow this system of accounting, at the start should familiarize himself with these cardinal principles, for in order to obtain the best results in the use of the system all members must be in sympathy with these principles.

The principles of accounting as laid down by the Accounting Committee of the Association of Electrical Manufacturers' Council (National Electrical Manufacturers' Association) and the Electrical Supply Jobbers' Association have been embodied in this system to the end that the electrical industry may be able to present correct, comprehensive figures as to the results the various branches are obtaining and the difficulties they are encountering, so that in future investigations by the United States Government or Federal Trades Commission the information obtainable will lead to intelligent legislation.

Of the foregoing six cardinal principles, the most important are:

2. All sales, whether contract, jobbing, day work, or retail, should be costed.

Unless the owner of a business is in position at the end of each month to tell the gross profit on his sales and determine the actual profit for the month he is working abso-

How Business Flows Easily through the Accounts in this System

lutely in the dark, and perhaps on false premises. In order to obtain the knowledge of his gross profits on the various classes of sales each month it is vital that costs be obtained on all contracts and sales. It may appear burdensome to the contractor to obtain costs on his sales, but there is no feature of the accounting end of the work that is so necessary, or that will pay for value received, as that entailed in obtaining costs on all transactions.

3. A merchandise account should be created through debit entries for purchases and credit entries at cost for materials sold in any way.

The users of this system must accept the principle of a running book inventory of their merchandise on hand, not waiting until the end of the year to learn the actual value of the merchandise without any check as to the proper amount the merchandise should equal.

The value of the merchandise on hand each month is obtained through the charge to Merchandise Account of all material purchased plus the material on hand when starting the use of this system; crediting to the account cost of all merchandise sold.

Naturally, some inaccuracies will creep into the costing of sales, but this account at all times should reflect, within 5 per cent., the amount of merchandise on hand, and this should be the basis for regulating the amount of insurance and purchase of material.

5. All liabilities should be vouchered each month irrespective of receipt of goods or correctness of invoice. Provision should be made for charging vendors for any errors or discrepancies in bills.

This principle can not be emphasized too strongly. All liabilities should be vouchered each month irrespective of receipt of goods or correctness of invoice. This is a radical departure from the old time custom of waiting until all questions of receipt of material or correctness of invoice have been adjusted. From a legal standpoint the purchaser is responsible for all material billed by vendor as soon as goods have been placed in the possession of the common carrier, especially as it is now the general practice to ship all material F.O.B. the factory. Adjustment due for any cause may be charged to the vendor's account, but the original charge should be approved for the entire amount, as far as the contractor's liability is concerned.

The system does not advocate the payment of liabilities created, if the factor of readjustment warrants withholding settlement until results can be obtained from debit memorandums to the vendor, but every contractor each month should face his legal obligations as to his liabilities. If this is done every contractor and dealer each month will be able to gauge his financial obligations and make proper provision for payment thereof.

We have dealt rather at length on these principles, as a firm belief in them is necessary for the proper use of this system and the placing of the business of our members on the plane to which we all aspire.

INSTRUCTIONS FOR USE

Section I. Instructions for Opening Books.—Necessary Steps in starting the system

Present books should be closed, the same as at end of any fiscal year, and trial balance obtained, including physical inventory of merchandise, tools and office appliances on hand.

The respective items in the trial balance should then be transferred to the proper accounts designated in the new trial balance sheet furnished, and corresponding accounts opened in the new general ledger in the same sequence as the various accounts appear in the trial balance book.

Care should be exercised in changing your former divisions of asset and liability accounts, also expense account,

so that they will agree with the divisions outlined in these instructions, as it is essential that all members have the same viewpoint in the classification of assets and liabilities and those affecting the operation of their business.

With these initial steps the proper trial balance has been obtained, and the general ledger started. Now come the various functions covered by the forms outlined in the key chart. See illustration Fig. 1.

The principal step now to be taken is some arrangement for obtaining the cost on all sales, either contract, day work, or store sales, so that as the work is completed, or the store sales ready to be billed, there will have been obtained the cost, as to merchandise, labor and productive expense, for use in the Sales Recapitulation Sheet. See Form 10.

The use of the various forms will be explained later in these instructions and each step in the completion of the records for the month will follow logically and will be explained as the use of each form is developed.

Section II—The Key Chart

This chart shows the slips, cards, envelope, tickets, bills, sheets and loose leaf pages used in the accounting system. For convenience all of these records are called forms, which, in fact, they are. Names of all forms are given. The lines connecting the forms indicate the sequence of the accounting operations or the way in which business flows through the accounts in the system. The number in each little panel refers to the reproduction and description of the actual form. For example, No. 11 of this chart refers to Form 11 and description of No. 11.

Be sure to study carefully the explanation of the general ledger account, overhead accounts, and how to close the books for the month.

Sec. III.—Forms and Directions

Only eighteen forms are necessary to the operation of this uniform accounting system. They are named in the key chart. These records, it is believed, provide a simple, accurate, and flexible accounting system for the average electrical contractor-dealer. The system is designed to meet the needs of the contractor who does no retailing, the dealer who does no contracting, and the business which includes both contracting and retailing. The contractor and the contractor-dealer will use all the forms, but the dealer who does a retail business exclusively will not need the first five forms. Central station electric shops that are organized on a departmental and profit-making basis, as they should be, will also be able to adapt this system to their needs. The value of a uniform accounting system to the retail trade will, of course, be most largely conserved if those who install the system hold down the variations from it to the smallest possible number.

While the system has been designed particularly to meet the needs of the average contractor-dealer whose present accounting methods are inadequate or unsatisfactory, the system will be found flexible enough to meet the needs of any size of business.

In the following pages the forms are described in the order in which they are numbered in the key chart. A careful inspection of the forms and the chart should make the system clear and easy to install.

Form 1—Requisition for Material

When an order for contracting work has been received from a customer naturally one of the first forms to be made out is a requisition for material. This form is necessary whether the shipment is from stock or from the vendor direct to the job. The form provides for this notation. However, it must be remembered it is an office form and not a purchase requisition. At the same time that a job is opened

with this form, the job envelope (No. 4) should also be opened. The requisition for material should be costed each day and filed in the job envelope. If it is necessary to keep a separate stock record, a duplicate will serve this purpose, permitting the original to go into the job envelope. Where material is shipped direct from vendor to job, duplicate or order sent to vendor should be placed in job envelope and costed to take the place of Form 1.

Form 2—Time Card

The time card is to be made out by the workman and turned in by him each day. The card should be filed under the workman's name so that all his cards are already assembled when computing his pay for the week. Before his card is filed, however, a separate card should be made out for each job listed on the workman's card. These cards are then to be filed in their respective job envelopes. The workman may not know the job number, but he certainly knows the name and address. The office or bookkeeper can then fill in the job number.

Number 3—Returned Material Record

Whenever any material is returned from a job one of these forms is to be made out, listing the quantity and kind of material returned. The workman, or whoever checks the returning material, can fill in all of the form excepting the cost column. The form is then turned over to the bookkeeper, who will cost the material and then file the card in the proper job envelope.

Form 4—Job Envelope

This envelope is intended to contain all of the records of material, labor, and direct job expense after costing. As the job progresses all of the information should be entered on this form printed on the front of the envelope. The column headed "Direct Job Expense" is for the entry of such items as "Telephone" and "Car Fare," indicated on the time card, also freight, express and cartage directly applying on this particular job. The sum of material total, labor total, and expense total will give the actual total direct cost of job. To this figure there must be added, of course, a percentage for overhead, and a percentage for profit when billing the customer. The information as to material, labor and direct job expense should be transferred to the duplicate of the customer's bill. The envelope should be filed numerically in the job envelope file.

If desired, the value of merchandise at cost on unbilled work can be obtained by adding the total of merchandise columns on the various job envelopes which have not been billed at the end of each month.

Form 5—Material Summary Sheet

Study this form carefully. It is intended to supply a long-felt need in the electrical contractor's accounting. Its purpose is to assist the contractor in assembling various types of material shipped, especially on day work, that is "time" and "material jobs, so that a condensed billing can be made quickly and accurately on completion of the work.

With this form it is necessary to write down the name of an article only once (unless there are more than five requisitions of it) and against it can be indicated the date, the amount of material issued, the total issued, any return, the total chargeable, the unit cost, the total cost and the selling price. Study the "fill-in" above on the three requisitions of wire and you will see the advantages of the form.

The final figure on material on each requisition is to be entered in the column of the same name on the job envelope. This summary sheet is to be filled in progressively, that is, whenever material goes out on a job.

Form 6—Charge Sales Ticket

No one form has been designed in this system for a charge sales ticket. This ticket will vary according to the

use of a cash register, duplicating sales register, or sales book. Whatever kind of ticket is used, provision should be made for obtaining cost on this type of sale.

Form 7—Cash Sales Ticket

No one form is recommended. Explanation and instruction for charge sales ticket holds good for this one, too.

Form 8—Bill to Customer

No one form is recommended. All bills should be made in duplicate. Use plain paper for the duplicate. The bill and duplicate will carry the job number and also a consecutive bill number. The duplicate is to be filed according to the consecutive number in a standard binder, from which postings are made direct to the sales ledger, that is "Accounts Receivable." The number on the duplicate is to be used as the folio number in the sales ledger column. When billing contract work, day work or store sales charged to customers, be sure to record on the duplicate the cost of the transaction, separating material, labor and direct job expense.

Form 9—Credit Memorandum

No one form is recommended. Forms in duplicate should be provided for sending credit memoranda to customers, covering any allowances or adjustments. The duplicates are to be retained in a designated binder. The cost, as to material, labor and direct job expense of such credits is to be duly recorded in the duplicate.

Form 10—Sales Recapitulation Sheet

Progressively during the month the amounts of bills rendered, together with the cost, should be entered on this form which is a recapitulation of amount of sales (i. e., contract sales, and time and material sales) amount of lamp sales, amount of store sales, and the cost of these sales. If you have an adding machine and do not wish to list each bill on the Sales Recapitulation Sheet compile the information and place only totals in respective columns at the end of month. At the end of the month the form will furnish the total sales with cost separated as to material, labor and direct job expense. These respective totals will be used in closing journal entries monthly, as explained later under "Closing the Books for the Month."

Notice that the form provides for contract work or time and material work, also stores sales. One article of store sales, i. e., lamps, is given two columns because of the present and future importance of this article, now that central stations are discontinuing the practice of renewing lamps and are putting that article on a strictly merchandising basis. "Cost of Lamp Sales" and "Cost of Store Sales" refer, of course, to the original direct cost of the goods, not to the overhead cost of selling. Two extra columns are provided on this sheet that can be used for any other sub-division desired, such as "Fixture Sales," "Repair Sales," etc. Credits issued to be totaled and costed when rendered separately to customers and deducted from respective totals on sales recapitulation at end of month, so that various totals will show net sales and respective net cost.

Form 11—Accounts Receivable

This is a simple form of sales ledger page, with debit, credit and balance columns, but if the particular business of any contractor necessitates a different form of sales ledger sheet, such sheet, of course, can be substituted.

Form 12—Cash Received

Enter all receipts from customers' payments in "Accounts Receivable" column, and discount deducted under "Cash Discount Allowed."

All receipts other than those affecting "Accounts Receivable" are to be entered in the column headed "General

once each month when bills are paid net or as frequently as bills become due on a discount basis, to the credit of such vendor's account in "Accounts Payable" column. These bills are to be provided with consecutive voucher numbers, which are to be recorded in the column indicated.

In order to obtain an analysis of the entries made under "Accounts Payable" column and to provide the proper debit entries, enter on the same line as recorded in "Accounts Payable" column the distribution of the amount credited to the vendor.

This debit classification for the distribution of a credit entry runs from "Merchandise" to "Miscellaneous." It is a very flexible arrangement. Columns headed "Merchandise," "Labor" and "Direct Job Expense" provide, of course, for the chief direct charges. The remaining columns, from "General Ledger" to "Miscellaneous" provide for any other account not columned, and also for the various overhead charges.

Columns from "Merchandise" to "Miscellaneous" are to be totaled at the end of the month and posted to the debit side of the account of the same name in the general ledger. Disbursements to "General Ledger" columns are to be posted to the debit of the respective accounts in the general ledger. The entries to "Accounts Payable" column are to be posted to the credit of the respective accounts in the accounts payable ledger.

For all overhead charges columned in this form, separate accounts should be opened in the general ledger for those omitted. It is well to beware of the "Miscellaneous" expense column, for it is too often the catchall of overhead charges, for which a separate account should be opened.

Debit distribution of all vouchers for which specific columns are not provided should be entered in "General Ledger" column and posted directly to same account in general ledger. There are a great many entries, such as rent, insurance, and other expenditures incurred so infrequently that it is not necessary to provide disbursing columns in this book, and these are to be entered in the "General Ledger" column as the items are vouchered to accounts payable.

We strongly urge that a Petty Cash account be kept, to be started on the following basis:

Draw voucher and give to book-keeper sufficient amount to take care of small cash expenditures for express and expense items for fifteen days. As the bookkeeper or cashier wishes to replenish the cash on hand, voucher the receipts held for expenditures in voucher disbursement book to credit of Accounts Payable—"Petty Cash Account"—and debit to respective expense columns in same book.

Check is then drawn to order of Petty Cash, and to cover such voucher and money turned over to the bookkeeper. Receipts from Cash sales or other sources must be deposited in bank and not confused with Petty Cash money.

Form 15—Journal

This Journal is to be used for all transfers from debt to credit of any accounts receivable and accounts payable or general ledger.

Certain closing entries at the end of each month are also to be made through this Journal, as explained later in "Closing the Books for the Month."

Individual items entered during month under either the debit or credit of the respective column should be posted directly to the various accounts in each book with the exception of the "Merchandise" column (both debit and credit) which can be totalled at the end of the month and posted in one entry to "Merchandise" account.

Form 16—Accounts Payable

Credit entries are obtainable from "Accounts Payable" column in the voucher disbursement book, and debit en-

tries from the "Accounts Payable" column in the cash book. This is a loose leaf form.

Form 17—General Ledger

The general ledger provided is a bound book with debit, credit and balance columns.

Full instructions for opening of the accounts and entries are provided in Section I.

Form 18—Trial Balance

When starting new system, trial balance should be obtained, and at the end of each month totals are copied from the general ledger, the accounts corresponding to those listed in the trial-balance book.

Printed spaces are provided in the trial balance book. If a more detailed classification is desired of either asset or liability accounts, or summary of operations, arrangements should be made, of course, to open corresponding accounts in general ledger for such additional classification.

The sizes of the Forms shown are as follows; Form 1, 5 x 7; Form 2, 3¼ x 6½; Form 3, 5 x 7; Form 4, 9 x 11; Form 5, 8 x 10; Form 10, 9 x 14; Form 11, 9 x 8; Form 12, 9 x 14; Form 13, 9 x 14; Form 14, 9 x 14; Form 15, 9 x 14; Form 16, 7 x 8.

SECTION IV

Closing Books for the Month

Closing the books for the month involves the Sales Recapitulation Sheet, the Cash Book, the Voucher Disbursement Book, the Journal, the General Ledger, and the Trial Balance Sheet, as well as the Summary of Operations.

How to handle each of these is told in order.

Sales Recapitulation Sheet:

Total all columns, and journalize as follows:

Credit total of "Const. Sales Billed" to "Sales Bills" account in general ledger.

Debit total of "Const. Sales Billed" to "Accounts Receivable" in general ledger.

Credit total of "Lamp Sales" to "Sales Billed" account in general ledger.

Debit total of "Lamp Sales" to "Accounts Receivable" in general ledger.

Credit total of "Store Sales" to "Sales Billed" in general ledger.

Debit total of "Store Sales" to "Accounts Receivable" in general ledger.

Debit total of "Cost of Sales" to same account in general ledger:

Credit total of "Merchandise Cost" to the same account in the general ledger.

Credit total of "Labor Cost" to the same account in the general ledger.

Credit total of "Direct Job Expense" to the same account in the general ledger.

Debit total of "Cost of Lamp Sales" to "Sales Billed" in the general ledger.

Credit total of "Cost of Lamp Sales" to "Merchandise" in the general ledger.

Debit total of "Cost of Store Sales" to "Sales Billed" in general ledger.

Credit total of "Cost of Store" to "Merchandise" in general ledger.

Obtain the cost of cash sales from duplicate cash sales slips, and make the following entries in the journal:

Debit the total cost of cash sales to "Cost of Sales" in general ledger.

Credit total cost of cash sales to "Merchandise" in general ledger.

Cash Book: Cash Received—Cash Paid Out

Note: Total columns and reverse amounts of "Cash Discount Allowed" (under "cash received" sheet) and "Dis-

count Earned" (under "cash paid" sheet) to opposite sides of cash book, as these accounts are to be posted respectively to the debit and credit sides of the same accounts in the general ledger.

Cash Book—Cash Received:

Credit total of "Accounts Receivable" to same account in general ledger.

Credit total of "Discount Earned" to same account in general ledger.

Credit total of "Cash Sales" to "Sales Billed" in general ledger.

Entries during the month in "General Ledger" columns should be posted individually to the credit of the proper accounts in the general ledger so that no postings in total are necessary at the end of the month.

The total receipts for the month, that is

"Accounts Receivable"

"Discount Earned"

"General Ledger"

"Cash Sales"

are to be posted to the debit of "Cash" in the general ledger.

Cash Paid:

Total all columns and post as follows:

Debit "Accounts Payable" to same account in general ledger.

Debit "Cash Discount" allowed to the same account in general ledger.

Totals of the two columns above named should next be credited to "Cash" in the general ledger.

The "Cash" balance in the general ledger should equal the difference between the "Bank" columns—as totaled at the end of the month—of the two halves of the cash book.

Voucher Disbursement Book:

Total each column and rule in red ink.

Credit total of "Accounts Payable" to same account in the general ledger.

Debit total of each column from "Merchandise" to "Miscellaneous" (with the exception of "General Ledger") to the respective account in the general ledger.

Debit any entries in "General Ledger" direct to individual accounts in general ledger.

To the debit side of "Merchandise" account in general ledger post the total of "Merchandise" in voucher disbursement book.

The entries in "Merchandise" column of the sales recapitulation sheet already have been posted to the credit side of "Merchandise" account in the general ledger plus the cost of Lamp and Store Sales.

The difference between the debit and credit in this "Merchandise" account will then indicate the value of merchandise on hand plus merchandise shipped to uncompleted work.

Use the amount of this "Merchandise account each month in determining insurance and merchandise investment, and reconcile with physical inventory whenever taken.

Debit "Labor" total to the same account in general ledger. This account reflects at all times the amount of labor invested in completed and uncompleted work.

Credit entries to this account are obtained from the sales recapitulation sheet.

Journal:

Use the journal for the following entries after determining upon the reserves and depreciations necessary for the year.

Divide the amounts by 12 and make entries monthly.

Note: The journal is also to be used in closing books for the year or any other time for entries between various accounts in the general ledger where transfer is necessary; but it is understood that the journal is merely a method of

transfer from one account to another appearing in any of the books of this system.

Credit "Reserve for Doubtful Notes and Accounts Receivable" and debit "Loss on Notes and Accounts Receivable."

Credit "Reserve for Depreciation on Furniture and Appliances" and debit "Depreciation on Furniture and Appliances."

Credit "Reserve for Depreciation on Automobiles" and debit "Depreciation on Automobiles."

Credit "Reserve for Depreciation on Tools" and debit "Depreciation on Tools."

Credit "Reserve for Depreciation on Merchandise" and debit "Depreciation on Merchandise."

The foregoing credit accounts appear as liabilities and the debit accounts appear as debits in the balance sheet.

The foregoing reserves and depreciations are recommended but can be enlarged or decreased at the option of the owner of the business.

Any entries made in the journal during the month for purpose of transfer are to be posted individually to the proper account in the general ledger.

General Ledger:

Accounts in the general ledger now should be balanced and entered in the proper place in the balance sheet.

Trial Balance Sheet:

The trial balance sheet covers Assets, Liabilities and Accounts under Summary of Operations.

The balances from "General Ledger" accounts should be transferred to the respective accounts as listed in the trial balance sheet and under summary of operation.

The accounts are all designated in the trial balance sheet as debit or credit as an aid to the proper analysis of these accounts.

The trial balance sheet should prove, of course, as to debits and credits, and separate statement then should be prepared covering Assets and Liabilities and Summary of Financial Operations both for the current month and the cumulative period of the year.

Surplus Account**Balance Sheet Accounts—Definition of Controlling Accounts****ASSETS****Fixed Investments**

Real Estate—Book value of land and buildings acquired for offices and warehouses, also all other land and buildings acquired by purchase or otherwise.

Furniture and Office Appliances—First cost of all new or important replacements of furniture, appliances, fixtures, etc., for offices or warehouses.

Automobiles—First cost of all auto trucks or other vehicles.

Tools—First cost, including transportation, of all tools, used in connection with contracting end of the business, except equipment chargeable to Furniture and Office Appliances.

Investments—Book value of bonds, mortgages, and stocks of other companies acquired for investment or other purposes.

Current Assets

Merchandise—For book value of materials carried in warehouses. This account will be charged with purchase cost of material received in the warehouse, and will be credited on the same basis with material shipped out. Sub-accounts will be carried with each warehouse or retail store-room.

Labor in Progress—This account will be charged monthly from the corresponding account in the Voucher Disbursement Book and credited from the corresponding account in the Sales Recapitulation Book. The difference between these debits and credits will represent the value at cost of the unbilled labor.

Note: The balance of this account should be checked at least once in three months with the actual time cards in the job envelopes, and any shrinkage due to labor not chargeable to any particular contract should be credited to this account and charged to "Cost of Sales" account.

Notes Receivable—For face amount of notes.

Accounts Receivable—This account represents the unpaid balances in open accounts against customers, as per "Account Receivable" ledger.

Trade Acceptances Receivable—For face amount of Trade Acceptances held.

Cash—This account represents the aggregate of cash on deposit with banks or other financial institutions.

Petty Cash—Represents amount of cash permanently advanced to the cashier for petty cash expenditures. The amount of this item can be included in balance sheet under "Cash."

Cash Advances—This account will be charged with all temporary and permanent advances to employees on account of traveling and other expenses when such advances are to be accounted for at some later date; also includes contingent funds placed in the hands of local managers for current and immediate disbursements and certified checks deposited with bids.

Deferred Assets

Insurance Premium Advances—This account will be charged with all premiums paid for insurance with the ex-

ception of automobile liability and will be credited monthly with a proper pro rata share of such premium as charged to "Insurance" account. The balance in this account should at all times indicate the net amount of premium paid for the unexpired period of existing policies.

Taxes Paid in Advance—This account will be charged with all payments for taxes upon real or personal property when such payments are in advance of the period covered by the tax. A pro rata share of such tax will be transferred monthly from this account to "Taxes" account. The balance in the account should at all times indicate the net amount of taxes paid in advance.

Deferred Charges to Income—To this account will be charged disbursements of an expense nature when applying to a period subsequent to the month in which disbursement is made.

Note: This account may be charged with unusual disbursements for stationery, printed forms, etc., when it is desired to spread the expense over a period of several months.

LIABILITIES

Capital Stock—Capital Stock Common, for face value of shares of common capital stock issued as per stock certificate books. If not a corporation this account should be designated as Capital Account and include all money actually invested by the owner.

Notes and Acceptances Payable—For aggregate of unpaid notes and acceptances payable.

Accounts Payable—For aggregate of unpaid audited vouchers covering purchases of material, payrolls and all other disbursements, as per "Accounts Payable" ledger.

Taxes Accrued—This account will be credited monthly with the estimated pro rata of annual taxes payable (when taxes are levied in advance payments must be charged to Taxes-Paid-in-Advance account. When the actual amount of taxes is ascertained, this account is to be adjusted.

Reserve for Doubtful Notes and Accounts Receivable—During the year this account will be credited monthly with the estimated amount of loss in collections, of amounts charged customers for the month as charged to "Allowances for loss on doubtful notes and accounts receivable" account. During the year this account will be charged with losses due to the inability of customers to meet their financial obligations.

Prior to closing the books at the end of the fiscal year this account will be adjusted so that a proper reserve is established to take care of anticipated losses on notes and accounts receivable balances. This reserve should at least equal the total of "Doubtful notes and accounts receivable" account.

Reserve for Depreciation, Furniture and Appliances—This account will be credited monthly with one-twelfth proportion of the estimated annual depreciation on the first cost of furniture and appliances in offices and warehouses, and "Depreciation of Furniture and Appliances" account will be charged.

Note: All standard furniture and appliances will be depreciated at the rate of at least 10 per cent. of first cost annually. Where building is leased depreciation on partitions, shelvings, etc., must be sufficient so that their book value is \$1.00 at expiration of lease.

Reserve for Depreciation of Automobiles—This account will be credited monthly with one-twelfth proportion of the estimated annual depreciation on first cost of automobiles and "Depreciation of Automobiles" account charged.

Note: Rates of depreciation must be at least 33 1-3 per cent. annually of the first cost.

Reserve for Depreciation, Tools—This account will be credited monthly with one-twelfth proportion of the estimated annual depreciation on tools, and "Allowance for De-

preciation on Tools" account will be charged with the same amount.

Note: Rates of depreciation must be at rate of at least 33 1-3 per cent. annually of cost.

Reserve for Depreciation, Merchandise—This account will be credited monthly with one-twelfth proportion of the estimated annual depreciation to take care of obsolete and slow moving stock, and "Allowance for Depreciation on Merchandise" account charged with corresponding amount.

Note: The rates of depreciation must be at least 6 per cent. annually of the value of the physical inventory at beginning of year.

We feel a word of explanation is due on the question of Reserves in General and particularly in the foregoing five Reserves.

Reserves are simply transfers from surplus accounts as precaution against future losses and if not used to offset loss are in reality a part of surplus.

Through creation of these reserves, the contractor faces frankly the problem of ultimate loss in these five asset accounts, and forces his customers to pay for these Reserves through their inclusion in his overhead expense.

Surplus Account—Before closing the books for the fiscal year an account should be opened called "Profit and Loss," and entries made thereto, either debit or credit, as required, as follows:

(a) Difference between book value and the actual physical value of merchandise inventory, as credited or debited to "Merchandise" account.

(b) Difference between amount of anticipated losses on notes and accounts receivable unpaid at the end of the fiscal year, as estimated, and amount of balance unused in "Reserve for doubtful notes and accounts receivable" account.

(c) The amount of balance open in accounts listed under Summary of Operation.

The net difference between all these entries will be the gain or loss in operation for the year, and the "Profit and Loss" account should be either credited or debited, as the case may be, with earnings or deficit for the year, and this balance either debited or credited to "Surplus" account.

Note: No entries to be placed in "surplus" account during the fiscal year.

Summary of Operations—Definitions

Sales Billed—This account represents the amount at which sales have been billed (less credit memoranda issued) also the amount of rebates and other deductions allowed to customers and others as an offset to the billed amount. The net amount of sales billed is obtained from sales recapitulation sheet.

Cash Discount Allowed—Allowances to cover discounts for cash settlements received from customers when such discounts are contingent upon settlement within a specified time.

Commissions Allowed—Allowance to agents and others for service in securing orders.

Cost of Sales Billed—This account will represent the purchase cost of sales billed, as credited in "Sales Billed" account in general ledger. The amount of the cost of sales billed is obtained from the sales recapitulation sheet.

Freight, Express, Carting unabsorbed—This account will be charged through voucher disbursement book with the amount of all transportation charges to and from warehouse; not directly absorbed through cost or through productive expense on job envelope. This account is part of cost of sales but is kept separate for purpose of information.

Commissions Received—Amount received from manufacturers and others as compensation for negotiating sales which are billed directly by the manufacturer or other vendor.

Cash Discounts Received—For cash discounts deducted in payment of vendors' invoices.

General Expense Accounts:

Salaries—(1) Officers and Department Heads—Compensation of President, Vice-Presidents, Secretary, Treasurer, Auditor, Sales Manager and Branch Managers.

(2) Clerks and Stenographers—Amount paid for services of all clerks and stenographers, typists and office boys. (Does not include service of warehouse employees.)

(3) Salesmen—Amount paid for services of all regular or special salesmen, specialists and solicitors.

(4) Warehouse (Stockroom) Employees—Amount paid for services of all warehouse employees, including warehouse superintendent, shipping clerks, receiving clerks, watchman, packers, drivers, porters, elevator-men and messengers.

Rentals—Amounts paid as rental of all offices and warehouse space, also taxes and insurance paid on rented or leased property.

Light, Heat, Power—All expense, not part of lease or rental charge, incurred in lighting or heating offices and in furnishing light, heat and power for warehouse.

Stationery and Office Supplies—Cost of stationery and minor supplies and conveniences, also books, reports, forms and miscellaneous office supplies together with freights or express charges thereon.

Traveling and Entertaining—Payments for transportation, hotel and other necessary expenses of travel for all employees, also expenses incurred in entertainment of customers.

Telegraph and Telephone—For all telegraph and telephone charges, including salary of switchboard operators.

Postage—Cost of postage exclusive of parcel post which is chargeable to "Freight, express and cartage (unabsorbed)" account.

Advertising—Expenses for advertising in newspapers, magazines, also cost of exhibitions and samples.

Taxes—For personal property or other taxes, accrued in

monthly proportions. (Taxes paid on rented or leased property are chargeable to "Rental" account.)

Insurance—Premiums on insurance on merchandise or fixtures in warehouse and on office furniture and appliances accrued in monthly proportions, also all liability insurance outside of automobiles (automobile liability insurance to be charged to "Automobile"). (Insurance paid on rented or leased property is chargeable to "Rentals" account.)

Association Expenses—Subscriptions and dues for membership in any association for business purposes.

Warehouse Stockroom Upkeep—includes all payments for packing materials such as excelsior, twine, laths, burlap, wrapping paper, etc., consumed in operation of packing or boxing, also cost of repairing and renewing all shortlived or inexpensive tools, together with freight and express charges thereon.

Interest—This account includes all charges for interest, whether for notes payable, trade acceptances payable or open account. The charges to this account are obtained from the "general ledger" column in the Voucher Disbursement Book.

Automobiles—Cost of maintaining and operating motor vehicles, such as rent of garage, garaging and charging of automobiles, repair and renewals of equipment, supplies (gasoline, oil) fire and liability insurance on vehicles.

Other General Expenses—Includes all incidental and miscellaneous disbursements (except warehouse expenses (not otherwise provided for in this classification), such as contributions to civic organizations, charitable gifts, donations, street car fares, advertising for help, directors' fees, state or municipal registration fees, minor emergency expenditures, not otherwise classified, fees for mercantile agency reports, etc.

Contingency Reserves and Depreciation:

Allowance for Loss on Notes and Accounts Receivable—

This account will be charged and "Reserve for Notes and Accounts Receivable" account credited monthly with an amount estimated, on previous experience, to be the loss for the current year's bad debts.

Allowance for Depreciation on Furniture and Appliances—This account will be charged monthly with one-twelfth of the estimated annual depreciation on furniture and appliances in offices and warehouses as credited to "Reserve for Depreciation of Furniture and Appliances" account.

Allowance for Depreciation, Automobiles—This account will be charged monthly with one-twelfth of the estimated annual depreciation on automobiles, as credited to "Reserve for Depreciation of Automobiles" account.

Allowance for Depreciation, Tools—This account will be charged monthly with one-twelfth of the estimated annual depreciation on tools as credited to "Reserve for Depreciation of Tools" account.

Allowance for Depreciation, Merchandise—This account will be charged monthly with one-twelfth of the estimated annual depreciation on merchandise, as credited to "Reserve for Depreciation of Merchandise" account.

The complete system will be furnished by the National Association complete, boxed, f.o.b. shipping point, for twenty-five dollars (\$25.00) to members and forty dollars (\$40.00) to non-members, and will include book of instruction that will enable you to open a new set of books or to make the necessary transfer of accounts from your present book to the new system.

[This system may be obtained direct from the head office of the National Association at 110 West 40 St., New York, or through the local sections. Until arrangements can be made for printing in Canada it will be necessary to pay duty in addition to the above figures.—Editor.]

A "Night Lettergram"

from Mr Brettell, President of the Vancouver Association of Electrical Dealers and Contractors is just to hand as follows:

"This is to notify you that we have now received definite news that Mr. W. L. Goodwin, of New York City, the man who launched the campaign against the "Ills in the Electrical Industry," and Mr. Samuel Chase, Special Representative of the Westinghouse Electric & Mfg. Co., Pittsburgh, will be with us at the monster Electrical Convention to be held in Vancouver City, on Monday and Tuesday, 26th and 27th of May, 1919.

"As a member of the great Electrical Industry you are invited to take this opportunity to meet other men in your particular section of the industry; by getting acquainted you may pick up ideas that will be useful to you.

"Acceptances are coming in from manufacturers, central station men, electrical inspectors, wholesalers, and contractor dealers, from Toronto, Edmonton, Saskatoon, Lethbridge, Calgary, Nelson, Vernon, and other places too numerous to mention.

"In order to help the committee in their work, will you please send a card (if you have not already done so) so that your name may be added to the list which now contains more than 75 names.

"Your wife, or sweetheart, is also invited to join us; special arrangements are being made to ensure that the ladies will return to their homes 'good and tired' after having had a 'REAL' time."

406 Yorkshire Building,
Vancouver, B.C.
26th April, 1919

Convention Committee: { Messrs. Brettell, Read, Rowland, Jarvis,
S. R. Smith, Crossman, Graham & Walker.

New Banfield Catalogue

W. H. Banfield & Sons, Limited, Toronto, have prepared a French edition of their lighting fixture catalogue, designed especially for Quebec province. The Banfield fixtures are meeting with splendid success. The company carry a big stock at all times so that they are able to give very prompt delivery. Each fixture is individually boxed which preserves the finish and makes for ease of handling and neat stock-keeping. Two of their recent designs are illustrated herewith.

Shall Central Stations Sell Electrical Appliances?

One of the questions most frequently discussed in electrical management circles is the advisability of central stations entering into the sale of electrical appliances, or whether they should confine themselves solely to the sale of electric current. The point was debated at length, it will be remembered, at the Toronto convention of the Ontario Hydro engineers last winter when the consensus of opinion appeared to be that it was decidedly the proper function of the central station to demonstrate appliances and to endeavor to popularize and create a demand for new appliances. In places where there were no contractor-dealers, or where these were not sufficiently aggressive to properly cover the field, there seemed no alternative but that the central station should step into the breach. There was no voice raised, however, in favor of the use of any but the established methods of merchandising—a fair profit and no price-cutting.

The attitude of the average hydro management towards this merchandising question is pretty well expressed, we believe, by Mr. G. W. Blay, of the Sales Department of the Public Utilities Commission of the city of London in their March issue of "The Live Wire" which, by the way, is the third issue of a very interesting publication destined, if one may judge by its record to date, to play an important part in

the development of the merchandising end of the industry in that city. Mr. Blay writes as follows:

The object of the Sales Department of the Public Utilities Commission is to popularize the use of electricity, doing so in a business-like way by the employment of sound merchandising principles. This department is self sustaining, prices are maintained and we do not have cut-price sales. In other words, we conduct a retail business on strict business principles, and we believe the community is served electrically far better than if we were not in this business.

Popularizing Electricity

To fully develop the washing machine and other large appliance fields, the deferred payment plan must be employed. The average prospect cannot pay out \$75.00 or \$150.00 cash for a household device. If that is required most people will do without. But if the payments are made easy the average householder can afford to use modern electrical conveniences. The ordinary contractor has not the capital to permit deferred payment selling. We can do business that way and by employing such a method can spread the gospel of electricity farther and wider than the contractor can without it.

We advertise liberally and pay a great deal of attention to our show window and sales rooms. Each month we feature some appliance. We do this by advertising in the newspapers, by special window display, by mail campaign.

By these methods the use of electricity in the home is popularized and the contractor and dealer receives a distinct benefit. They cash in on our advertising, for it also appeals to those of their customers who are in the habit of buying things electrical from them. It increases the total sale of appliances in the city and each contractor naturally gets a share of the new business.

We are also in a position to give better break-down service than the contractor. Our trouble men are specially

trained to locate and correct faults in the appliances we sell.

Our relations with contractors are quite amiable. We turn over wiring and repair jobs to them and we do not take an unfair price advantage.

It is sometimes maintained that by entering the merchandising field, we as a public utility, are taking advantage of our position as author of things electrical in the community. We agree. We are taking an advantage, but it is not an unfair advantage, as we are following a business-like course. If we do not utilize our position in this way we will not be advancing electrical industry as we should. We have a responsibility to the industry that cannot be shared by any other branch of it. We distribute the energy which is the foundation of the business and if we can legitimately increase the use of electrical energy we should do so.

There may come a time when the contractor-dealer can fully and competently handle the sale of electrical devices. Although this may now be the case in individual instances, broadly speaking it is not so. Until that time we have our place in the merchandising field.

A New Tumbler Switch

The Duncan Electrical Co., Ltd., Montreal, have just designed, and are now manufacturing, a new tumbler switch. It will be noticed from the accompanying illustration that the cover is merely snapped on, in place of the old method of the use of screws. Another feature is that the wire holes in the base are sufficiently large to allow the loom to be inserted into same; thus doing away with the cutting of the loom when the latter projects through the plaster. This makes for better insulation. The lever is insulated with hard fibre, reducing breakages to a minimum. The switch is quick

make and break. Installations should be made with the lever up, and with the switch blades also in that position. To switch the light on, simply press the lever gently downward.

Hamilton District Electrical Association

At the April meeting, in the Royal Connaught Hotel, of the Hamilton District, announcement was made by the president, Mr. V. K. Stalford, that the membership of the association was 100 per cent. for the city of Hamilton. This does not include the applications from associates and members from outside districts. This must be very encouraging to the officers. A number of very interesting subjects were discussed at this meeting; one in particular was a new agreement from Local 105, I.B.E.W., for a new schedule of wages to take effect on May 1, 1919. This subject was discussed at great length. It was decided to submit a proposal to the Local to have working rules similar to the Toronto district association, adopted in the Hamilton district. A conference committee was appointed to meet the conference committee of local, to discuss the matter further.

On Monday, April 21st, at the Royal Connaught Hotel, Hamilton, a further meeting of the Hamilton District Elec-

trical Association was held. There was a very large number of members present. The report was received from the Conference committee who had been negotiating with local 105, I.B.E.W. It is proposed to adopt and put into effect working rules in the Hamilton district similar to the rules at present in use in the City of Toronto. The committee reported progress in this matter. Another meeting is to be held in the immediate future with the representatives of local 105 to discuss the matter further.

The question of electrical merchandising was discussed at great length at this meeting. The outcome of the discussion was that a committee of five was appointed to consider this very important subject and bring in a recommendation to the Association at the next meeting.

Better Light for Sewing

The sewing machine is naturally placed in a corner of the room where, ordinarily, there is a minimum of light. It follows that either one must go to the trouble of moving the

machine—often a laborious job and apt to scratch the floors—or work under unfavorable conditions of illumination. Considering the nature of this work and the unusual strain on the eyes, it is doubtful if there is any point in the home at which a real good light is more necessary. This fact renders very timely the appearance of a contrivance illustrated in the accompanying photograph. It is called the Se-To-So sewing light and is manufactured by the Durkee-Davis Manufacturing Company, Rockford, Ill. This light is adjustable and may be concentrated in various positions for hand work. Considering the mistakes and delays caused by inadequate light on sewing operations it is easy to believe that the installation of this equipment could soon pay for itself in increased product and excellence, to say nothing of the saving to the operator's eyesight.

"One City 100 Per Cent. Wired Up"

Contractors and central stations in more than 400 cities in the United States have signified their willingness to co-operate with the Society for Electrical Development in the nationwide house wiring campaign, "Electrify Your Home." It is interesting to note that of all the 11,000 contractors and central stations to whom the story of the campaign was sent only one has flatly said "You can't do anything for us." That city is Pasadena, California. The message, which comes from the Municipal Light Department is brief and to the point. It says:

"Sorry we have no need for your campaign literature inasmuch as every house in Pasadena is wired and connected. Population 42,000—electric meters connected 15,600. Can you beat it?"

Until all Canadian towns and cities can say the same as Pasadena there is profitable work for the contractor-dealer without ruinous competition on new buildings.

Toronto Inspection Department Moving

The Electrical Inspection Department of the District of Toronto have sent out the following notice, signed by Mr. A. G. Hall, district inspector, advising change of address.

"Kindly take notice that the Electrical Inspection Department, District of Toronto, will move from their present quarters, Room 201, Temple Bldg., to Room 125, Crown Office Building, 26 Queen East, cor. Queen and Victoria streets, on the 29th inst. Telephone numbers will be Main 3541, 3542, 3543.

"We will endeavor to carry on business without interruption and would respectfully request that all applications for inspections required on April 30th be in our office at 201 Temple Building not later than 3.00 p.m., Tuesday, April 29th, after which date permits will be issued from, and all mail addressed to :

"The Electrical Inspection Dept.,
Room 125, Crown Office Building,
26 Queen Street, East, Toronto."

Letter to the Editor

The following is an extract from a letter just received from one of our readers:

"An investigation into the business conduct of the Marconi Wireless Company would seem to be in order. Two returned soldiers with whom we have spoken in the last few days advised their families by wireless when they were nearing Halifax, but neither of these messages were delivered. If these two cases are typical of the way the messages are handled it looks as though somebody were getting something for nothing. A recent newspaper item states that the Dominion government is granting \$61,200 a year in subsidies to the Marconi Company."

The Bay State Street Railway Company, which operates in 90 cities and towns in eastern and south-eastern Massachusetts and extends into New Hampshire and Rhode Island, has been sold at auction for \$3,600,000 under a reorganization plan by which the property will eventually be in the hands of the Eastern Massachusetts Railway Company and operated by five public trustees.

Current News and Notes

Cloverdale, B. C.

The local light commissioners at Cloverdale, B. C., have renewed for another year their contract with the B. C. Electric Company for supplying power to the town. It is proposed to extend the system up as far as Surrey Centre and estimates to this end are being prepared.

Edson, Alta.

The Edson Light & Power Co. Limited, Edson, Alta., have been incorporated.

Halifax, N. S.

A hydro-electric commission, along the lines of the system that has obtained in Ontario for the last ten years, is announced as the latest step in the program of the Nova Scotia government. To this end two bills, one respecting the development of electric power, from water resources, and the other respecting water and water courses, have been introduced in the provincial legislature.

London, Ont.

The London Street Railway Company have arrived at an amicable settlement of the demand for increased wages recently made by their employees. The new scale involves a

general advance of three cents an hour with a maximum rate of 38 cents. Twelve cents an hour extra will be paid for overtime, Sunday work to come under this heading.

Montreal, Que.

The Golden Electric Company, Montreal, have registered. They are electrical contractors and dealers in supplies.

Letters patent have been granted to the Montreal Armature Works, Limited, Montreal, who will take over the business now carried on by the Eastern Electric Company. The capital stock is \$50,000 and the provisional directors: S. D. Sweetman, Stanley H. Cunha, P. J. Dolan and G. A. Druett.

Peterboro, Ont.

The Bell Telephone exchange building at Peterboro was destroyed by fire on April 20th.

Regina, Sask.

The ratepayers of Regina, Sask., will shortly be asked to vote on the "one-man" car question. Permission to operate this type of car was given a few weeks ago in the provincial legislature, but it was provided that the matter should be voted on locally in each case.

St. Thomas, Ont.

The city council of St. Thomas, Ont., have granted the London and Port Stanley Railway Company permission to place two extra tracks in Kains street for switching purposes, providing adequate protection is given at crossings.

By-laws will be submitted to the ratepayers of St. Thomas on May 27th seeking the expenditure of approximately \$45,000 on street railway improvements.

Swift Current, Sask.

The Carter-Jones Electric Company, Limited, Swift Current, Sask., have been incorporated.

Toronto, Ont.

The Toronto Electric Supply Company are opening an office and showrooms at 170 Bay Street, Toronto.

Fire on the night of April 27th caused loss estimated at about \$100,000 to one of the buildings of the Canada Wire and Cable Company, Dundas Street, Toronto. The main factory was saved.

Vancouver, B. C.

To assist its employees in finding homes, and thereby relieve a serious situation in Vancouver at the present time, the B. C. Electric Railway Company have set aside a fund of \$50,000 which will be loaned at six per cent. for a term of twelve years. In discussing the project, General Manager Kidd said: "My reason for making the proposal was to relieve, as far as possible, our employees from the pressure of high rents, give them homes of their own, and thereby induce thrift and interest in their community. Many of them have been inconvenienced by having the homes they rent sold over their heads. Some of our employees already had lots but had not the wherewithal to build unless at high rates of interest, when the monthly charge for interest and principal would be much heavier than rent."

Vernon, B. C.

The city council of Vernon, B. C., have found it necessary to increase the lighting rates. Commencing May 1st the rate will be 14 cents for the first 100 kw.h.; 13 cents for the next 200 kw.h.; 12 cents for the next 300 kw.h., and 11 cents for all over that, subject to a discount of 20 per cent. if paid before the 15th of each month. The old rate was 12 cents up to 500 kw.h., with a similar discount.

York Township, Ont.

A by-law submitted to the ratepayers of York township, authorizing an expenditure of \$200,000 for the purchase of existing lighting systems and their extension, was passed on April 5th.

Assistant to Manager 1900 Washer Company

This opening offers a splendid future to an ambitious man capable of shouldering responsibility. Must have both commercial and mechanical ability and be qualified to assume oversight of all branches of merchandising, accounting, and manufacturing. Applicants must have good previous record for ability and integrity. No application except by personal letter considered. Address H. H. Morris, 357 Yonge St., Toronto. 9

Generator Wanted

WANTED—A 200 K.W. generator set, consisting of Diesel Engine with 60 cycle 2200 volt 3 phase generator. Also one 400 K.W. set ditto. Full particulars with price to Box 300, 119 Board of Trade, Montreal. 9

ed that water from the fire service system can be turned into the generator from the basement. For the latest turbogenerator of 35,000 kw. now being installed two fire hose connections are installed in the generator casing on the station floor. One of these connections is on each side and so arranged that water under pressure would play upon the end turns. A fire hose is laid beside the machine ready for emergency.

Placing hose connections in the generator casing permits service connections being made quickly—and speed counts, it prevents accidents occurring such as those due to turning on water under high pressure with a hose nozzle turned off, flooding of floors and adjacent apparatus, and thus tends to reduce the extent and seriousness of internal turbogenerator fires. Having a hose connection available, ready for connection with a water or steam line is preferable to having the water or steam line actually connected up, because of the possibility in the latter case of water leaks, or steam condensate entering the generator, or accidental opening of the valves.—Electrical Review.

How a Washer Washes

A great many merchants have formed an incorrect idea of how an electric washer really washes. This is particularly true of the dolly-type washer, the prevailing opinion being that in this type the clothes are cleansed by rubbing against the corrugated sides of the machine. This is not the case, however, for in this as in all other types the clothes are washed by circulating the water through them, the corrugations being principally camouflage, although they do agitate the water to some extent. This was explained in a recent address by Thomas Casey, Chicago.—Electrical Review.

Kraft Cord "Braiduct"

Made in Canada under Canadian Patent No. 147,057

This cut is reproduced from an actual photograph, and illustrates the behavior of the material in this rigid test—perfect flexibility. We cut the ends to show plainly the superior construction—note the high grade Canvas Duck Lining and the KRAFT CORD winding. This KRAFT CORD is made to our own specifications and is fire-proofed, which is entirely new.

KRAFT CORD "BRAIDUCT" is in a class by itself—superior to any imported conduit—is absolutely the last word in flexible non-metallic conduit construction.

We are now making our own insulating compounds, consequently every lot will be uniform in flexibility, and every foot is fished at the factory.

KRAFT CORD "BRAIDUCT" is easy to instal—easy to cut—easy to secure, as it is made in our own country, and easy to buy, as our price is right.

KRAFT CORD "BRAIDUCT" is packed in heavy fibre boxes, each box containing four coils (1,000 ft.), insuring product against damage in transit.

KRAFT CORD "BRAIDUCT" is regularly inspected and labelled by the Underwriters' Laboratory under the direction of the National Board of Fire Underwriters and every coil carries their label.

We will be glad to send you a sample.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

The P. L. Robertson Mfg. Co., Limited

MILTON, ONTARIO

One of the drivers supplied FREE

ECONOMY renewable Fuses

appeal strongly to users who place safety above every other consideration and to those who take pains to eliminate all unnecessary expense.

ECONOMY FUSES afford maximum protection to electrical circuits because they are correctly designed and accurately rated. They cut annual fuse maintenance costs 80% because an inexpensive "Drop Out" Renewal Link restores a blown ECONOMY FUSE to its original efficiency.

The ECONOMY was the first successful renewable fuse—and is the most successful today, both in service and in value.

ESTABLISHED 1849
BRADSTREET'S

Offices Throughout the Civilized
World.

Executive Office:

Nos. 346 and 348 Broadway, New York City,
U. S. A.

THE BRADSTREET COMPANY gathers
information that reflects the financial condi-
tion and the controlling circumstances of every
seeker of mercantile credit. Its business may
be defined as of the merchants, by the mer-
chants, for the merchants. In procuring,
verifying and promulgating information no ef-
fort is spared, and no reasonable expense con-
sidered too great, that the results may justify
its claim as an authority on all matters affect-
ing commercial affairs and mercantile credit.
Its offices and connections have been steadily
extended, and it furnishes information concern-
ing mercantile persons throughout the civilized
world.

Subscriptions are based on the service fur-
nished and are available only by reputable
wholesale jobbing and manufacturing concerns,
and by responsible and worthy financial, fidu-
ciary and business corporations. Specific
terms may be obtained by addressing the com-
pany at any of its offices. Correspondence in-
vited.

THE BRADSTREET COMPANY

Offices in Canada: Halifax, N.S.; Hamilton,
Ont.; London, Ont.; Montreal, Que.; Ottawa,
Ont.; Quebec, Que.; St. John, N.B.; Toronto,
Ont.; Vancouver, B.C.; Victoria, B.C.; Win-
nipeg, Man.; Calgary, Alta.; Edmonton, Alta.;
Sydney, N.S.

Man. Western Canada, Toronto.

An Achievement in Lighting Efficiency

The Amelite

IN the drive for new trade, a bright and scientifically lighted store is one of the elements of marked success.

The AMELITE gives you every feature essential to satisfactory store lighting. It combines in one piece the advantage of separate bowl and reflector. It is an achievement in lighting efficiency.

Quickly and easily installed; one piece, no connections. Handsome, yet moderate in cost. Each AMELITE packed securely in individual container. Fixture furnished, if desired.

For large store rooms, the 14 inch AMELITE means the utmost in efficiency at the lowest practicable cost.

Write for prices today.

Overhead Construction in Mt. Royal Tunnel, Canadian Northern Terminal Electrification, Montreal, Can.
W. C. Lancaster, Elec. Engr.

Special Standard Bronze (S. S. B.) High Strength Trolley Wire

was used in this electrification because, after rigid tests by unbiased engineers and careful comparison of results with similar tests on hard-drawn copper and steel, the superior strength, rust- and wear-resistance of S. S. B. Wire were found to meet every requirement of a service characterized by great extremes of temperature and hard usage.

The clearance in this tunnel is only 16 feet and the messenger cable had to be kept under great tension so as to flatten the catenary and reduce the sag to a minimum. S. S. B. Wire was, therefore, used here for both trolley and messenger.

S. S. B. Wire can be supplied in 40 and 60% conductivities as compared with copper.

Height 2½ inches, diameter 1½ inches
with two ¼ inch wire grooves.

The galvanized lag screw, which is securely cemented into the insulator, is flattened just below the insulator for engaging a wrench.

Especially adapted for use in mines, and for rural lines, general service lines etc.

BUYERS AND SELLERS OF
NEW AND USED MACHINERY

A Continent-wide Service

Resurface your Commutators While in Service

Ideal Commutator Resurfacers

You no longer need to turn down commutators on a lathe. The Ideal will cut down high mica, ridges and high bars and smooth out low spots while machines are under load! Works on both commutators and collector rings. The Ideal is an abrasive block—not a natural stone that clogs with copper dust, but a manufactured product of uniform density and cutting quality throughout. Guaranteed to give satisfaction. Saves time, labor, expense. Used by biggest concerns on the continent.

Our free trial offer will convince you. Send the coupon—you will incur no obligation.

Westinghouse

Automatic Electric Ranges

The Westinghouse "Automatic Electric" is a full sized range large enough for any family, yet economical even when cooking for two. It revolutionizes cooking.

The time clock turns on the current at any hour set. The automatic thermometer turns it off when the ovens reach the desired temperature. Then the ovens use no more electricity, but continue to cook the meal with the stored up heat, like a fireless cooker.

Every part of the range can be kept sweet and clean. Everything can be instantly removed from the ovens, and the ovens, which are lined with rust-resisting metal, thoroughly scoured and dried. There are no inaccessible places for dirt or crumbs to collect.

Type 3-19-B Full-Automatic Electric Range

Type 2-19-B Semi-automatic Electric Range

We also manufacture non-automatic electric ranges, and semi-automatic ranges in which the current is turned on by hand and an automatic thermometer rings a bell when the desired temperature is reached, as a reminder to turn the current off by hand.

There is not a more economical electric range than the Westinghouse, nor one that is more convenient, substantial and durable.

Our nearest Office will give Further Particulars

---	--	---	-------------------------------------	--	---	--	--	---

This **SOLENOID SWITCH** has been adopted
by the Hydro Electric Commission

They use it for
STREET LIGHTING

Now the fact that it is used by the Hydro-Electric Commission is proof that it is all we claim for it. It certainly is not an experiment. by the fact that it is giving efficient service in many towns throughout Ontario, as well as the other provinces.

No springs, swivels or other complicated mechanisms to give trouble. They close magnetically and are opened by gravity assisted by the tension of the laminated copper contact. All arcing is taken up on the carbons.

Increase the efficiency of your system and decrease the cost of installation by using our Type 17 H.E.P. Solenoid Switches, which are suitable for any frequency on multiple circuit or D.C. Series circuit.

HUGHES Electric Ranges and Water Heaters

From Coast to Coast during the month of June we are advertising HUGHES Cooking and Heating Devices.

The Canadian people are demanding the Electric Range. We are helping create that demand.

Of course, Mr. Dealer, you are going to grasp this opportunity to increase your revenue by joining this Dominion-wide campaign on Canada's most popular Electric Range—"THE HUGHES." Manufactured in the only factory in Canada producing a complete line, from the large Hotel to Bakery Type equipment down to the Kitchenette size—a Range to meet each and every requirement.

Cooking by electricity is the most scientifically correct and ideal method known to-day—food is perfectly cooked and more nutritious, supreme cleanliness, economical in time and money. No one once using will ever return to other methods.

Sell yourself the idea, your Customer already has it. We are placing this Idea before one and one-half million prospective customers.

Your proportion of the results is how much?

You will find your answer at our nearest Local House. Don't delay. Obtain it at once.

Final Judges Approve O-B Gas Weld Bonds

A user of any product is the final judge of its worth. The experiences of two O-B Gas Weld Bond users are recorded below:

A Canadian road made the first commercial installation of O-B Gas Weld Bonds. Traffic consists of heavy interurban cars, frequent freight trains with electric locomotives and occasional electric passenger trains.

After the O-B Bonds had been in service about three years they were inspected and found practically 100 per cent. good.

A high-speed interurban recently used about 5500 O-B Gas Weld Bonds for rebonding.

The property volunteers the information that due to these O-B Bonds it has been able to:

- Give better service.
- Keep better schedules.
- Reduce armature burn-outs.
- Cut power cost.

Other roads are getting the same results. Send for booklet.

Write to us—the manufacturers—to-day for particulars.

*British Material
Canadian Workmanship*

The C. & H. Meters have long held the premier position for their accuracy, simplicity and scientifically correct construction.

Besides being absolutely the best instruments you can install for reliability, they represent a combination of Canadian and British production. With the war ended many of the obstacles of obtaining raw material from Britain have been removed, and we are now in a position to make old time prompt delivery.

A Time and Labor Saving Screw for Electrical Contractors

Robertson ^{Patented} Socket Head Wood Screw

In these days of high costs of labor and material, you want to save wherever you can. The Robertson Socket Head Wood Screws will save time, money and material. They are easy to drive—all you have to do is place the screw on the driver—it sticks there, enabling you to drive at arm's length if you wish. Indispensable for use in hard-to-get-at places, such as between joists, under floors or between narrow openings.

Let us prove our statements by sending a few samples and our prices.

We supply bits to suit any ratchet, also drivers in all suitable styles free with first order.

THE "TYPE S" PORTABLE WHEATSTONE BRIDGE

Useful in the Shop and Laboratory for the Measurement of Resistance
Adapted for Fault Locations in Telegraph and Telephone Lines and Cables.

The Type S Bridge is a thoroughly practical instrument for shop and field use. Being complete in every detail it is ready at all times for immediate use. It is easily portable, its weight being but 8 pounds. The precision of adjustment of its coils (Rheostat 1/10 per cent., Ratio 1/20 per cent.) insures accurate measurements. The galvanometer, the weakest element of such an instrument, is unusually rugged. It is a separate element and may be removed for examination or repair by taking out two screws. The battery is of the ordinary "flash light" type, and renewals may be procured practically everywhere. The price is \$66.25 net, f.o.b. Philadelphia, boxed for shipment.

Bulletin No. 530 describes this instrument.

Devoe Type "A" Externally Operated Safety Service Switches

MADE IN CANADA

BY CANADIANS

FOR CANADIANS

- | | | |
|---|---|---|
| (1) Steel box built according to the latest rules of the Hydro. | (7) Square steel operating rod having moving arms attached and connecting to yoke enabling all blades to make contact at same time. | (11) Locking device to prevent switch being closed if necessary. |
| (2) Slotted screw hole enabling one man to install same (This is of great help to the wireman). | (8) Snap catch with hole for padlock. | (12) Strong check preventing strain on switch when operating. |
| (3) Front Jaws make 90% contact. | (9) Monson Slate Base. | (13) Blades are made of 98% Pure Copper having two spring washers well rivetted to hinge jaws and making 90% contact. |
| (4) Auxiliary quick break blades attached direct to blades. | (10) Holding-down screws enter from back with nuts on top, making removal of switch easy. | (14) Fibre yoke mounted on copper blocks pinned and soldered to blades. |
| (5) Extra heavy Cast Iron Handle. | | |
| (6) Moving arms made of iron well rivetted together and connect- | | |

There are good reasons for the acknowledged superiority of the Devoe Safety Type Switches.

A few of them are stated above, study them.

It is points such as these that make the difference between a switch that merely looks good and a switch that actually is good.

Devoe Safety Switches are designed and built with painstaking care. They embody every known and tested feature of design and construction that can make for simplicity, efficiency and durability.

Devoe Safety Switches may be purchased with absolute confidence in the real satisfaction they will give and in the actual economy they will effect.

There are **many** styles to meet any need built by the Devoe which is a reminder and a pledge of **Quality**.

All our Safety Type Switches are examined and labelled under direction of the Hydro Electric Power Commission of Ontario.

Summer is Coming

with its hot sultry days. Doesn't the idea suggest to the live dealer a splendid opportunity to sell electric Household appliances.

The modern housewife is quite willing to be shown how she can eliminate drudgery from her housework, especially during the hot summer months.

All she needs is to have the advantages of electric Household appliances explained to her.

From the standpoints of comfort, convenience and cleanliness in her kitchen equipment the present-day housewife is recognized as a discriminating buyer.

C. G. E. electric appliances have always been acknowledged leaders in their respective fields. They are the product of years of research work by experts.

Edison Mazda Tungsten Lamps Keep Down Lighting Expenses

Better Lighting at less cost is the object in the construction of Edison Mazda Lamps. That this object has been well achieved is borne out in the fact that Edison Mazda Lamps now enjoy an enormous distribution and sale throughout the Dominion.

Whether for the factory, the home or the automobile, Edison Mazda Lamps will give the utmost service in effective illumination, durability, candle power and length of life. The economy they effect is of vital interest to you.

Don't forget that Edison Mazda Lamps are the product of Canadian Capital and Labor. When you buy them, you are promoting the interests of your own community.

The Edison Mazda Booklet, "Edison Mazda Means Electric Light for Everybody," can be secured from your Dealer or is sent gladly upon request.

Die-Cast
Metal
Bushings

Die-Cast Metal Bushings Do Away With Clamps

Clamped fittings, because of irregularities in themselves or in the porcelain, may exert excessive spot-pressure upon your insulators. Cemented fittings work loose under continuous vibration or may crack the porcelain by reason of the cement's shrinkage.

In "FRANKLIN" Post Type Insulators, such fittings are eliminated. "FRANKLIN" construction provides metal bushings which are moulded to the porcelain.

The intimate contact of these bushings with every point of the porcelain's circumference, brings about an even distribution of strains. Thus the carrying capacity of the Insulators is multiplied, and the likelihood of breakdown reduced to the minimum.

Freedom from flash-over points and a general structural superiority which is apparent in every detail, also recommend "FRANKLIN" Post Type Insulators to your consideration.

Other "FRANKLIN" Specialties for Generating Stations are Disconnecting Switches, Potheads, Doors for Bus and Switch Compartments, Instrument Cut-out Switches, Cleat Type Insulators, Air Pressure Relays, and the new "FRANKLIN" Fuse. Write for descriptive Bulletins.

Service Which Builds Good Will For Manufacturer, Dealer and Central Station

Manufacturers of electric-driven labor saving devices know that the service their product gives is very largely dependent upon the motor used. That is why so many of the leading manufacturers of electric-driven devices equip their product with R & M Motors. Uninterrupted service and enthusiastic users are insured by the un-failing reliability of the motors.

For the same reason central stations can recommend R & M equipped devices to their customers with the know-

ledge that users of these devices will be satisfied users and boosters for central station service.

R & M Motors are found on leading motor-driven devices for all services in the home, office, store, factory—everywhere that electric-driven labor saving devices are used. Electrical dealers and central stations can sell and recommend these devices with R & M Motor equipment, knowing they are built throughout on a quality basis and that they will make good in service.

Electric Trucks Used Extensively In Coal Delivery.

In Boston, Chicago, New York and elsewhere, electric trucks are employed extensively in the movement of coal from the yards to consumers. A study of comparative operating costs indicates that coal is moved at a lower cost per ton mile by electric trucks in the cities than by any other form of transportation. This fact is being realized by many large coal companies, and, as a result, there are some far-reaching developments contemplated in the further application of electric trucks to this particular class of business.

Electric trucks, by virtue of their successful operation, have also won for themselves the high esteem of representative manufacturers of, and dealers in, ice. The Consumers Company of Chicago, Ill., employing twenty-six (26) electric vehicles, may be taken as indicative of the introduction of electric transportation into the ice business. Owing to the mildness of last winter, there will be a great scarcity of ice this summer, and consequently prices of this very necessary commodity will probably reach new heights. Those companies using electric trucks will be conducting the distribution phase of their business—probably its most costly feature—at minimum expense possible and besides will be assured of uninterrupted service from their electric transportation units, blessed with but extremely few moving parts and very simple control.

B. C. Government Appoints Public Utilities Commissioner.

Major John L. Retallack has been appointed by the government of British Columbia to be Public Utilities Commissioner for the province under the new Public Utilities Act. Major Retallack is a returned soldier having gone overseas as quartermaster of the 48th Battalion. Later he was transport officer in the railway corps. He is a mining engineer and a member of the Canadian Mining Institute. The new commissioner was born in Quebec on December 2nd, 1863, and was educated in England. He served for five years with the Royal Northwest Mounted Police before coming to British Columbia in 1890. The appointment of Major Retallack came after several days of public clamor when the government's first appointment of R. H. Gale, mayor of Vancouver, met with such opposition from the returned soldiers' organization that Mr. Gale tendered his resignation. Several weeks ago it was reported that Mr. Gale was slated for the position. Returned soldiers' bodies immediately protested, pointing to the government's promise to give returned men preference for any positions. When the appointment of Mr. Gale was announced on April 17th, gatherings in Vancouver denounced the move in such terms that Mr. Gale went to Victoria to consult the cabinet. On his return on Saturday, April 19th, he announced that he had resigned. Mr. Gale had been active in opposition to the B. C. Electric Railway, the largest public utility in the province and on his resignation made this statement:

"To be perfectly frank, having had charge practically of the city's side of the case in the B. C. Electric dispute, I prefer to be in the position of arguing this side of the case before the commission rather than sit in judgment upon it. It is four years since I started in to attempt to secure cheaper light and power, and it is only naturally that I would like to present my arguments on the city's behalf as their advocate on what I have always believed to be the merits of the case as it exists to the first tribunal before whom it has been possible to have our case presented for consideration."

Immediately on Mr. Gale's resignation, the cabinet of the province recommended the appointment of Major Retallack and the lieutenant-general made the appointment forthwith.

Canadian Association of British Manufacturers.

The Canadian Association of British Manufacturers and their representatives has been established with branches at Toronto and Montreal. Similar associations have existed in Australia and New Zealand for several years. The objects of the association as set forth in the constitution are as follows: "To further the interests of British trade throughout the Dominion of Canada and to affiliate with and work in concert with kindred associations in other centres of the Dominion having similar objects."

The executive council of the Toronto branch of the new association comprises:

- J. Wilson, president (dry goods).
- G. A. Marshall (steel) vice-president.
- H. V. Andrews, (wool).
- C. W. Beal, (pottery).
- Captain Harris, (shoe polish).
- J. Haywood, (groceries, coffee, etc.).
- E. V. Pannell, (aluminium & electrical lines).

The executive council of the Montreal branch will probably be elected in the near future.

"Every man owes some of his time to upbuilding the profession to which he belongs."

Electrify Harbour Tracks

The Harbor Commissioners of Montreal have decided to proceed with the electrification of the harbor railway tracks, held up by the war, and plans are now being prepared. The entire tracks running the length of the harbor, will be electrified, thus replacing the present steam system. The following advantages are claimed for the scheme. The doing away with all the inconveniences that are bound to occur with steam engines on short runs, including the smoke nuisance, and with the multitudinous shunting operations necessary for the transshipping of the many products that enter the port each year, and also the quicker handling of all goods. It has many advantages over steam for terminal traction; economy in operation and maintenance; flexibility of control; availability for immediate service; fewer units required for equal service; elimination of corrosion of steel and galvanized iron by acid gases; fire danger reduced and standby losses much reduced. This year the electrification will be pushed as far as possible, in fact, it is expected that that part of the system between Victoria Pier and Montreal East will be in operation by September 1st. The ultimate terminus of the system will be Bout de L'Ile.

Montreal Electric Luncheon

The last meeting of the Montreal Electrical Luncheon for the season was held on April 30th, when Captain Trivett, of the Y.M.C.A. Red Triangle Hut, Montreal, described the work of the Y.M.C.A. at the front and in Canada. He also told in some detail of the expenditure involved, particularly in relation to the providing of comforts in France and at the Red Triangle huts in Canada; and of the officers who accompanied the vessels with demobilized men on board and the trains from Halifax. Mr. T. H. Chennell, the secretary of the luncheon, submitted a report of the past season. The attendance, he said, had grown from an average of 48 in 1916 to 70 in 1919. About 125 firms were represented by those who attended the 23 luncheons of the season. The finances had been looked after by a special committee. The sum of \$76 had been raised for patriotic funds. Votes of thanks were passed to Mr. W. H. Winter, the president, Mr. Chennell, secretary, and to the papers and entertainment committees.

Annual Meeting Electric Club of Toronto

The annual meeting of the Electric Club of Toronto and the final meeting of the 1918-19 session was held on May 9, the president, Mr. K. J. Dunstan, in the chair. The programme consisted in a brief valedictory by the president, the presentation of reports by the honorary secretary and honorary treasurer and the election of officers for the coming year.

Mr. Dunstan expressed his appreciation of the co-operation of the members during his term of office and congratulated them on the very satisfactory standing of the club as shown by the report of the secretary and treasurer and laid particular emphasis on the high standard of the speakers who had favored the club during the year. He also paid a well-deserved tribute to the work of the secretary, Mr. Frank Kennedy,—a sentiment vigorously applauded by the members.

The secretary's report showed that twenty-seven meetings had been held at which the following speakers had addressed the Club:—

"Experiences during summer of 1918 spent in England and France," Kenneth J. Dunstan, President.
 "Architecture," Alfred Chapman, Architect.
 "The Evolution of the Aeroplane," J. A. D. McCurdy, Curtis Aeroplanes & Motors.
 "British Naval History," R. S. Neville, K.C., Official Referee Supreme Court.

"On Keeping Step," Prof. A. T. DeLury, Prof. of Mathematics, University of Toronto.
 "Agriculture Yesterday and To-day," Hon. Geo. S. Henry, L.L.B., Minister of Agriculture.
 "Canada's Heritage in the St. Lawrence River," A. V. White, M.E., Consulting Engineer to the Commission of Conservation.
 "Women After the War," Miss Wiseman, President Canadian Business Women's Club.
 "Britain's Burden in the War," Hon. Dr. H. J. Cody, Minister of Education.
 "History of Money," Charles T. Currelly, Director Royal Ontario Museum of Archaeology.
 "Forest Conditions in Canada," Prof. C. D. Howe, Associate Prof. of Forestry, University of Toronto.
 "From the Viewpoint of a Jew in Modern Days," Rabbi Jacobs.
 "The Story of the Diamond," James Ryrie, Ryrie Bros., Ltd.
 "Educational Adjustments Resulting from the War," Sir Robert Falconer, K.C.M.G., President University of Toronto.
 "A Journey Through Spain," Prof. Alfred Baker, University of Toronto.
 "Wireless Telephony," Dr. F. B. Jewett, Director of the Research Branch of the Bell Telephone System and Chief Engineer of the Western Electric Co.
 "Labor in Relation to Reconstruction Problems," James T. Gunn.
 "Recent Developments in Astronomy," Prof. C. A. Chant, University of Toronto.
 "Mechanical Transport and its Development with the Canadians during the War," Capt. F. E. H. Johnson, M.C.
 "The Heart of Gaspe," Prof. A. P. Coleman, Dept. of Geology, University of Toronto.
 "Repatriation," Brigadier-General Gunn, C.M.G., D.S.O.
 "An Electric Blooming Mill Drive," E. S. Jefferies, Chief Electrical Engineer, Steel Co. of Canada, Ltd., Hamilton.
 "History of Architecture in France," Prof. John Squair, University of Toronto.
 "Preparation of Sera and Vaccines and their Uses in the War," Major J. G. Fitzgerald, University of Toronto.
 "Rubber and its Uses," J. H. Coffey, Jr., Chief Engineer and Efficiency Manager Gutta Percha & Rubber, Ltd.
 "Chippewa Development," H. G. Acres, Chief Hydraulic Engineer, Hydro-Electric Power Comm. of Ontario.
 "Life and Conditions in Paris, Alsace-Lorraine and the devastated part of France during the War and in the Rhine Section of Germany after the Armistice," Monsieur Paul Balbaud.

The report showed a paid membership of 181, as against 175 the previous year. The attendance ran as high as 125. The report of the honorary treasurer, Mr. H. D. Burnett, showed total receipts of \$402.55 and a balance on hand of \$86.03.

The election of officers for the year 1919-20 resulted as follows: President, W. R. Carr; vice-president, Geo. D. Perry; honorary secretary, H. H. Couzens; honorary treasurer, C. H. Hopper; executive, K. J. Dunstan (ex-officio), D. H. McDougall, W. A. Bucke, J. H. Martin, W. P. Dobson, Joseph Rogers, W. R. Greenshields, S. L. B. Lines, Geo. K. Hyde.

Engineers' Club of Peterboro

The Engineers' Club of Peterboro, Ont., recently held its annual election of officers, which resulted as follows: Hon. president, C. E. Canfield; president, G. R. Munro; vice-president, R. H. Parsons; secretary-treasurer, R. L. Dobbin; directors—two years, R. B. Rogers, P. L. Allison, H. O. Fisk; one year—E. R. Shirley, Jas. Mackintosh, G. R. Langley. The club has had a request for co-operation from the local Board of Trade, and the members have expressed themselves as ready to help in any way possible.

The Water Power Commission of the province of Nova Scotia have issued a progress report covering the field investigations carried on throughout the province during the year ended September 30th, 1918, under co-operative agreement between the Nova Scotia Water Power Commission and the Dominion Water Power Branch.

A National Organization of the Engineering Profession

By Mr. F. R. Ewart

On one thing the engineers of Canada are pretty thoroughly agreed—that our present organization, or lack thereof, is extremely unsatisfactory. Regarding the nature and extent of the trouble and the best cure, there seems to be no unanimity of opinion. In fact, the divergence is so great, and many of the views expressed are so indefinite, that it appears high time that some plan should be proposed as a basis from which to proceed. It is not expected, that the scheme hereinafter outlined should be immediately recognized as the perfect panacea for all our ills. It may, however, serve as the raw material from which a satisfactory working model will finally evolve.

Aims of Organization

All the purposes for which engineering is, or might be, organized can be divided under two heads:

(1) **Technical**—Mutual self-improvement in technical knowledge through meetings, papers, discussions and publications on technical subjects—or any method whereby the special knowledge of one member may become the common property of all.

(2) **Professional**—Elevation of the calling in popular esteem to the dignity of a profession. By legal protection and otherwise to maintain as high a standard of ability and conduct as possible, for the benefit of the public as well as of the membership.

Our engineering societies up to the present have been devoted exclusively to technical purposes. Thought has frequently been given to the professional side, but almost invariably it has been found that the very efficiency of our organizations from this technical viewpoint has been the chief stumbling block to professional progress. Our medical and legal associations are just the reverse, being highly effective professionally, but serving little towards technical advancement. Now that engineers are feeling more than ever the necessity of proper attention to professional considerations, the problem of reorganization must be faced.

The Single Society Idea

The tendency in the past has been to develop a separate society in each branch of engineering. It is useless to argue that this should not be so. As long as engineers feel a desire for organization for technical purposes, the process of sub-division is an inevitable consequence of increasing specialization. For many years in Great Britain, the British Institution of Civil Engineers was the only engineering organization. Its membership embraced engineers of every description. The engineering sciences were then in their infancy and the engineer was usually more of an all-round man. When mechanical, electrical and mining engineering made such strides that it became practically imperative for a man to choose a single branch, separate institutions were organized. In spite of strenuous opposition from those who held to the single society idea, these younger organizations to-day are extremely strong and apparently established for all time. It is inconceivable that a retrograde movement could take place. The history of engineering in Canada and the United States is very similar. In every main branch of engineering we have a separate society, large and powerful. These organizations have developed technical work most efficiently and the benefits being derived in this respect could not be sacrificed by any active member.

Unfortunately, engineering can gain proper professional

weight and recognition only as a unit. No one branch can speak or act for the whole profession and there is no effective co-operative machinery through which all organizations can function together. Nor could each branch be given separate legislative treatment, for the exact boundaries between one practice and another can never be accurately defined. It must be freely conceded, therefore, that the present system is utterly useless for furtherance of professional aims, no matter how effective it may be on the technical side.

A single society embracing engineers of every stripe in a common membership has often been strongly urged. There can be no doubt that such a society could and would be quite efficient from the professional standpoint. But as means of technical progress it must prove of little value. Must we then seek to make up our deficiencies in one respect by relinquishing most of the progress we have made in the other direction? Or should it be necessary for an engineer to belong to two organizations—one technical and the other professional? It must be remembered that conditions must be dealt with as they now stand. It is neither necessary nor desirable to sweep away everything and rebuild from the ground up. It must be evolution—not revolution.

Scheme of Federation

The best solution of the whole problem would appear to be the development of a systematic scheme of co-operation, which will still leave the most complete autonomy for technical purposes to all existing organizations. This might be accomplished by a system of co-ordinating councils. The accompanying diagram gives a graphic conception of the idea. Only a limited number of branches of engineering are shown, but the plan is capable of extension to include any number.

The fundamental unit is the local section, represented by circles. These are all tied together to their respective society headquarters, indicated by ovals. Each oval with its corresponding circles represents a complete society in one branch of engineering, practically as constituted at present. Every individual engineer in a recognized and organized branch of engineering will be a member of a local section. Even when living in a remote district he should belong nominally to the nearest local section, or to one with which he has recently been connected. The only change in this will be to have all isolated members attached nominally to some section or other. It would be desirable to extend the geographical section system more systematically than in the past. Every large centre of population or of engineering activity should have properly organized sections in every branch of engineering for which there are enough engineers to make section activity practicable.

Given a double franchise in the local section and at society headquarters, no engineer would be deprived of his full share of influence. It remains, therefore, to establish a system of co-operative councils, local, provincial and national, to obtain a unified profession which can take action in matters of public import. Regardless of the scope of any question that might arise, there would be a properly constituted body to deal with it, speaking for every engineer within the territory affected.

The organization of local councils should be based on

the fundamental principle of equal representation of all sections. If the number of sections is large, one representative from each will be sufficient. If the number is small, two or three representatives may be appointed by each section. But in no case should any one section be able to control the council. Such an arrangement will assure every branch of engineering and every engineer a fair share in directing local activities of common concern. It may be noted from the diagram that any isolated local society may be given representation on the local council. In this way the weight and influence of many good engineers might be given much broader scope than is possible in their present very detached position. Representatives on the council might be appointed by the executives of the sections, but it would be far better if they were elected by vote of the full membership of the sections. A seat in council should be recog-

Representatives on the provincial council should be appointed by local councils within the province. While the prevailing principle would be equal representation for each local council, a method should be devised whereby all main branches of engineering would also be represented and as nearly equally as possible. This might be accomplished by drawing lots to determine to which branch of the profession the representative from each local council should belong. In any event it should not be difficult to devise some method whereby the provincial council could be made thoroughly representative, both geographically and by branches. It would not be practicable to have the election of members of the provincial council directly within the power of the general membership of the local sections, as such a method would remove the guarantee of balanced representation. No method could be satisfactory which

nized as one of the highest honors in the gift of a section, and the best possible man should be secured to fill it. It would also be essential to each section to appoint a man who will stick on the job, as otherwise the section will fail to exercise its due share of influence.

The chief function of the local council will be to make its weight felt in local (or civic) affairs. Public works are now controlled almost exclusively by laymen, while the engineers appear shamefully indifferent. A local council representing every engineer in the city could render much valuable assistance in such matters, and show the people at large that the engineers are public spirited citizens. A local council may also co-operate with the Board of Trade on any and every matter of civic welfare. By such means the engineering profession might become a great power for good in the community.

makes it possible for any one geographic section of the province or any single branch of the profession to gain control of the provincial council. The responsibility of local councils in their appointments to provincial council, therefore, again emphasizes the great care which should be taken by local sections in their appointment to local council.

The chief function of the provincial council would be to deal with all engineering matters of general application throughout the province. It should guide the provincial legislature on engineering problems coming within its field, just as the local council would act in civic affairs. A specific function of most serious import, with which a provincial council might fittingly deal, would be the matter of registering, licensing or otherwise controlling admission to the profession under the provision of a provincial act.

The establishment of such acts is distinctly within the jurisdiction of our provincial legislatures. It would therefore be essential for the provincial council to be so representative and of such high personnel that responsibilities of this nature could safely be entrusted to it.

National Council

The national council should be appointed in equal numbers by the headquarters officers of the various societies. It would not be possible to have a direct representative of every local council on the national council, as the number of the former would eventually be too large, and it would not be possible to assemble them regularly enough to transact business efficiently. The same effect for all practical purposes could be obtained by a provision that on all matters of sufficient importance and that time limits permitted every local council should be consulted by correspondence.

The functions of a national council are too obvious to need much comment. The great value of the assistance rendered by the engineering profession to the various national governments during the past war requires no special emphasis here. There can be little doubt that this usefulness would have been increased considerably had there been a complete and thorough national organization for the purpose. The lessons taught by war should not be forgotten in peace. Engineering can be just as useful to the life of the nation in peace as in war, though possibly in less spectacular ways.

Communication

The proper methods of communication should be clearly defined. Since it might be urged that the scheme involves a degree of complication that would result in confusion, it is very necessary that besides clearly defining the exact organization and functions of the various bodies, the methods of communication between them should be equally well understood. The following outline of the purposes of the various lines gives a rough idea of this phase of the question:

A—lines—Purely internal society affairs—all matters strictly pertaining to the individual branch of the profession governed by the society in question.

B—lines—Matters of national concern on which headquarters executives are in a position to completely advise. All executive work on previously approved courses of action.

C—lines—All matters of purely local scope of mutual interest to more than one branch of the profession.

D—lines—All matters within the scope of one individual province. All isolated local sections affected gain representation through lines (C and D). As provincial questions will usually require work or advice of local councils, it will not likely be either necessary or desirable that a direct line equivalent to C and D be established.

E—lines—All matters of national scope on which opinion should be voiced geographically rather than according to branches of the profession. The proper use of the E line in place of A and B lines will be fairly obvious.

F—lines—Will involve only occasional use. Any matter of mutual concern to two local councils may be dealt with through F lines. If matter involves more than two local councils all within the same province, D lines should be used. If two or more in different provinces, E lines must be used.

G—lines—All matters in which the national council can be of assistance to provincial councils in helping to secure a reasonable degree of uniformity and consistency in the actions of the latter bodies. For example, to make the variation between methods of legislative control of the profession in the different provinces as slight as possible. In

general, however, E lines would be used in preference to G lines for gathering nation-wide opinion on most matters.

Finance

Generally speaking the expenses of local, provincial and national councils should not be very high. Secretarial work would be the chief item, though some moderate provision for travelling expenses might be necessary for the latter two. Provision for a proper share of such expenses should be made in the budgets of the local sections with such assistance as may be necessary from the parent societies. As the expense would not be very great and the benefits to be derived should be large, the financing of the scheme should not prove a very serious impediment. If the results to be expected can be realized, it does not seem unreasonable that the individual member might pay a slightly higher fee than now commonly asked, and still get better value for his money. Again, if the complete organization resulted in a general licensing system for engineers, the money raised by license fees might easily prove adequate to defray the expenses not only of provincial councils but even of local councils as well.

Other Benefits

If this plan were carried into effect it should give the engineer the fullest possible expression professionally as well as technically. It should have another decided advantage for any engineer whose interests extend to two or more branches of the profession. He could be placed nominally in the society which covered his chief interest and also be fully recognized in the other branches from which he desired benefit. A complete system of co-operative organization should result in very general exchange courtesies for attendance at technical sessions, in practice as well as theory, as pertains at present. If it became common practice for engineers in one branch to attend such meetings of other branches as appeal to them, all feeling of obligation would disappear. Every engineer would be a member of organized engineering in general, even though nominally attached to one individual branch. In this way a man would have all the advantages of every branch in which he was interested without the necessity of belonging to more than one. If he wished the publications of another society he should have the privilege of subscribing for them at magazine rates, which would return a moderate profit to the society in question. By such means the necessity would be avoided of belonging to several societies to attain full satisfaction of technical needs. In fact, as the professional phase became fully developed, it might be considered proper to restrict every engineer to one society or branch, from the voting standpoint at least.

Possible Objections

As previously suggested, objection may be raised on the grounds of complication. An automatic machine tool is very complicated but it does wonderful work. If every part is designed for its job, and properly keeps its place, only harmony can result. A uniform system of nomenclature by which the various bodies are designated, should avoid confusion provided that all other matters are distinctly defined.

Perhaps it may be said that the multiplicity of committees and councils may make it difficult to find the right men to fill them. That is one great weakness of our present societies. Not more than two to five per cent. of the membership are given definite work to do for the betterment of their society in particular and the engineering profession in general. The large remainder contains hosts of capable men, whose ideas and energies should be utilized to the full. The progress of any organization must depend greatly on the amount of useful work that is done by it.

The committee system is about the only known method of employing the rank and file of the membership in productive work.

This is only a rough sketch of the scheme. Much detail would have to be decided, and many points adjusted to put it in working shape. To do so will require a lot of hard work, patience and perseverance. If, however, the article embodies a general idea which can be accepted as feasible and desirable, and is a basis for further action, its purpose will have been fully served. It seems to be the only line

on which real progress can be made towards the fullest technical and professional effectiveness. Even if the ideal of a single all embracing society were possible of consummation, there can be little doubt that separate societies would keep springing up in the future. If, on the other hand, we can achieve a form of organization that will insure the fullest measure of freedom, independence, and equality between the various branches of the profession, it matters little what name the whole organization goes by. We can call it one society if we like.
